

Modelling Ice Shelf/Ocean Interaction

Ben Galton-Fenzi

bkgalton@utas.edu.au

Antarctic Climate and Ecosystems CRC
Hobart, Tasmania, Australia

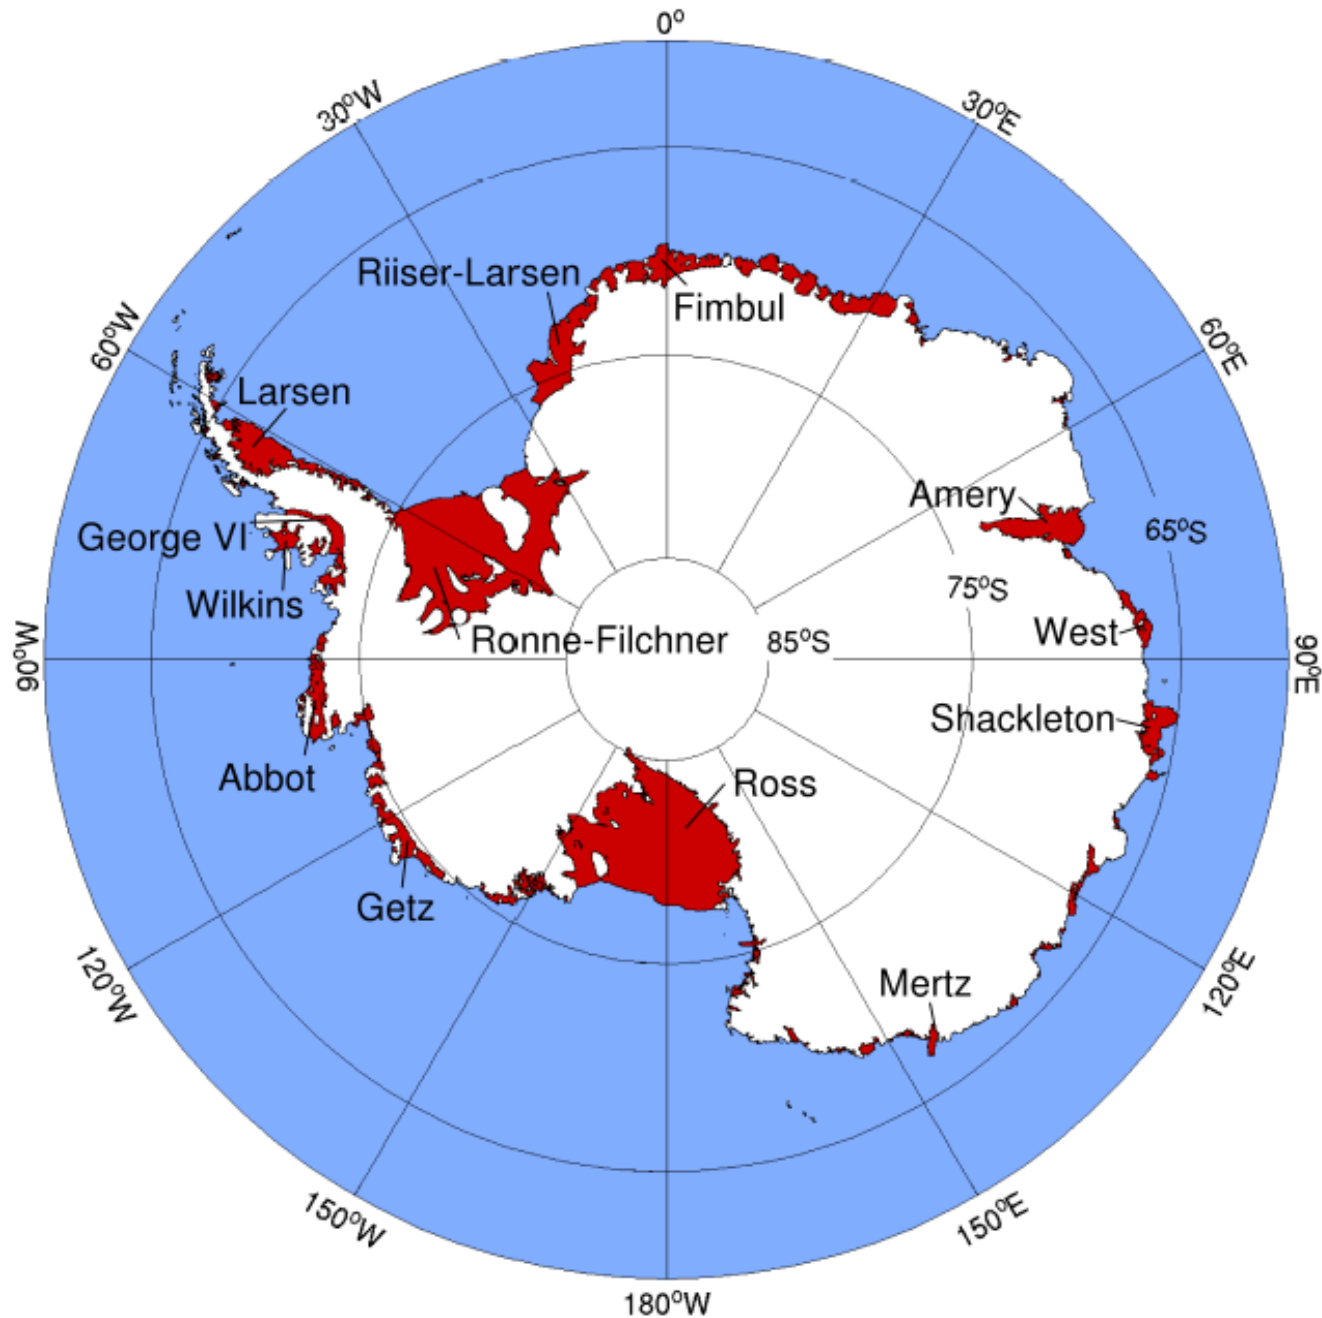

IPCC Fourth Assessment Report Summary for Policymakers (2007)

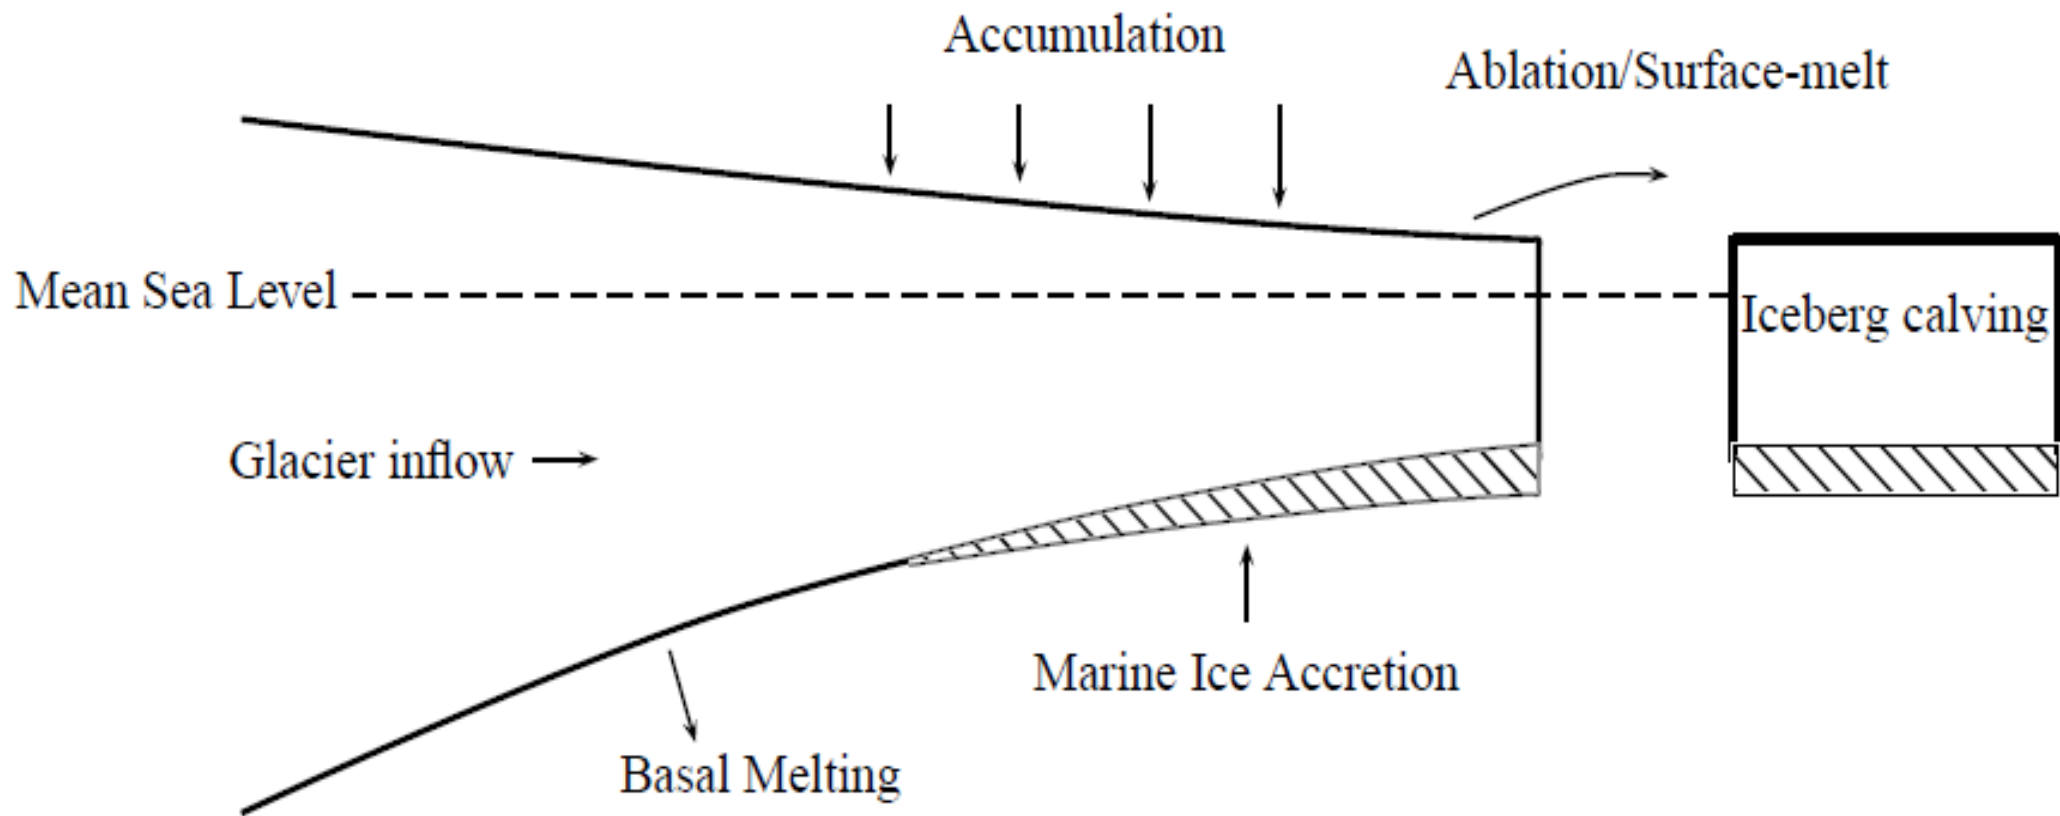

“ The corresponding increased ice sheet mass loss has often followed thinning, reduction or loss of ice shelves ...” p 7.

“ Dynamical processes... ...could increase the vulnerability of the ice sheets to warming, increasing future sea level rise. **Understanding of these processes is limited and there is no consensus on their magnitude.**” p 17.

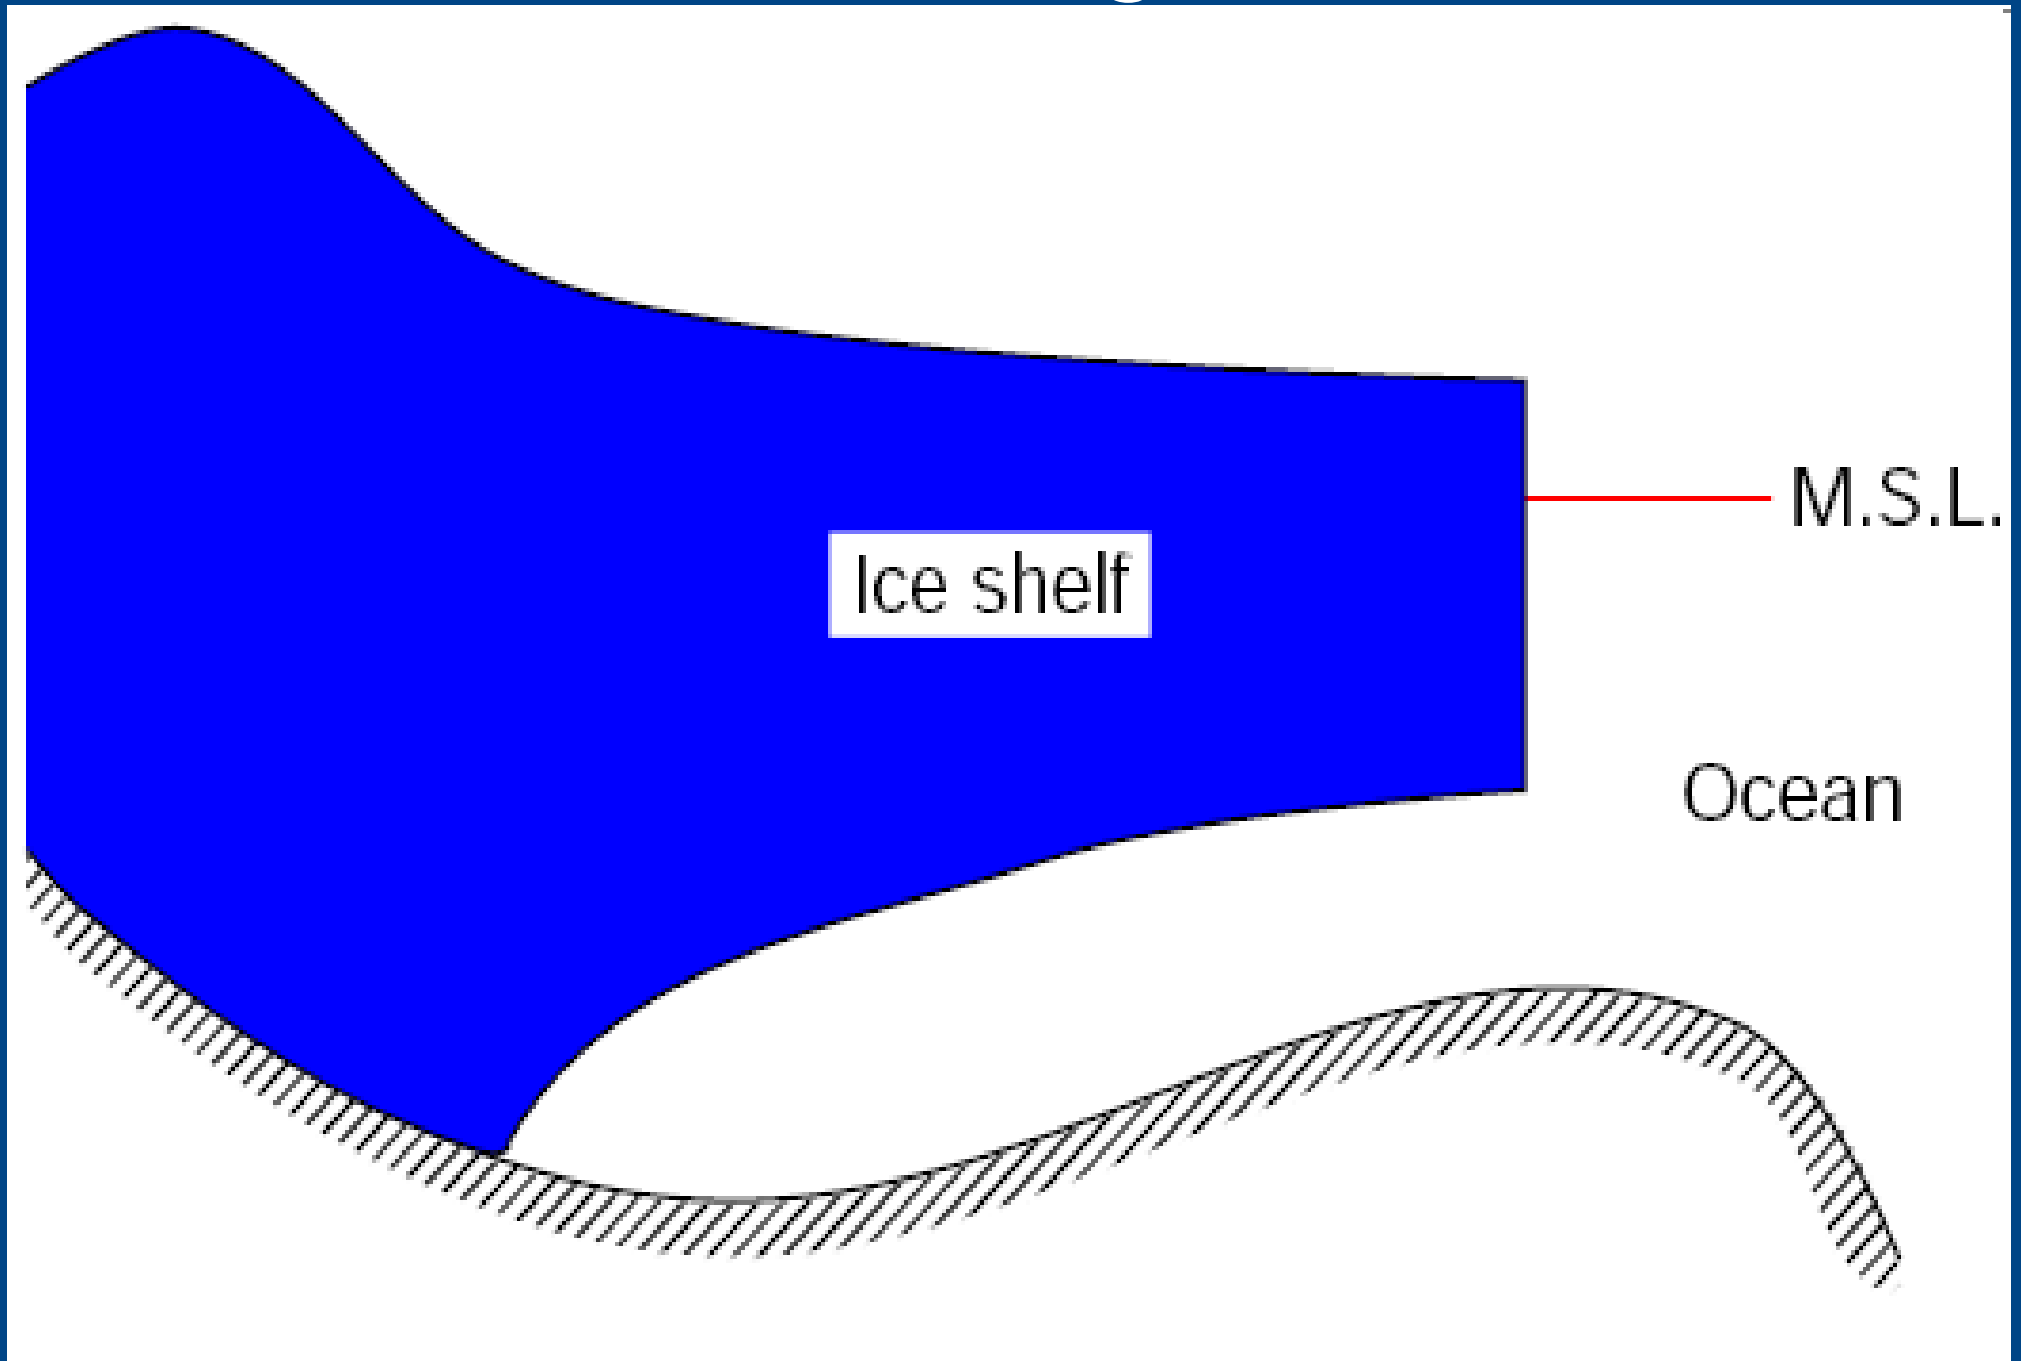

Ice shelves connect the ice sheet to the oceans

Estimates of AABW production

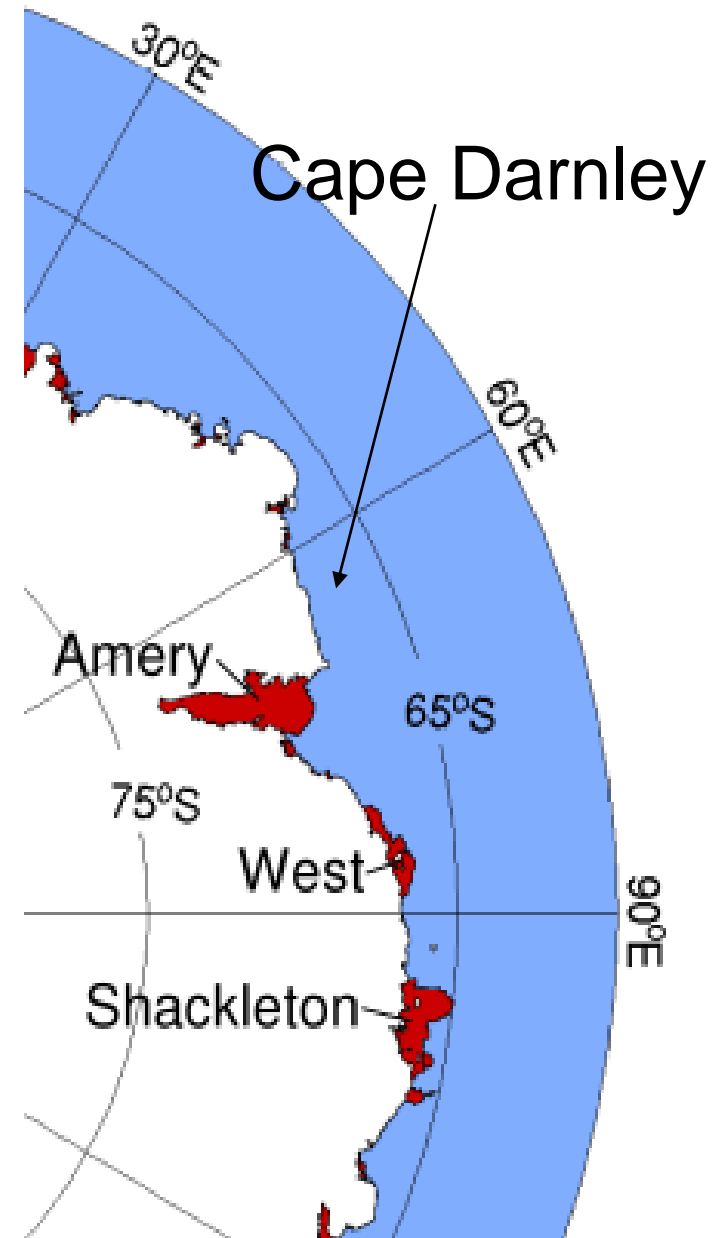

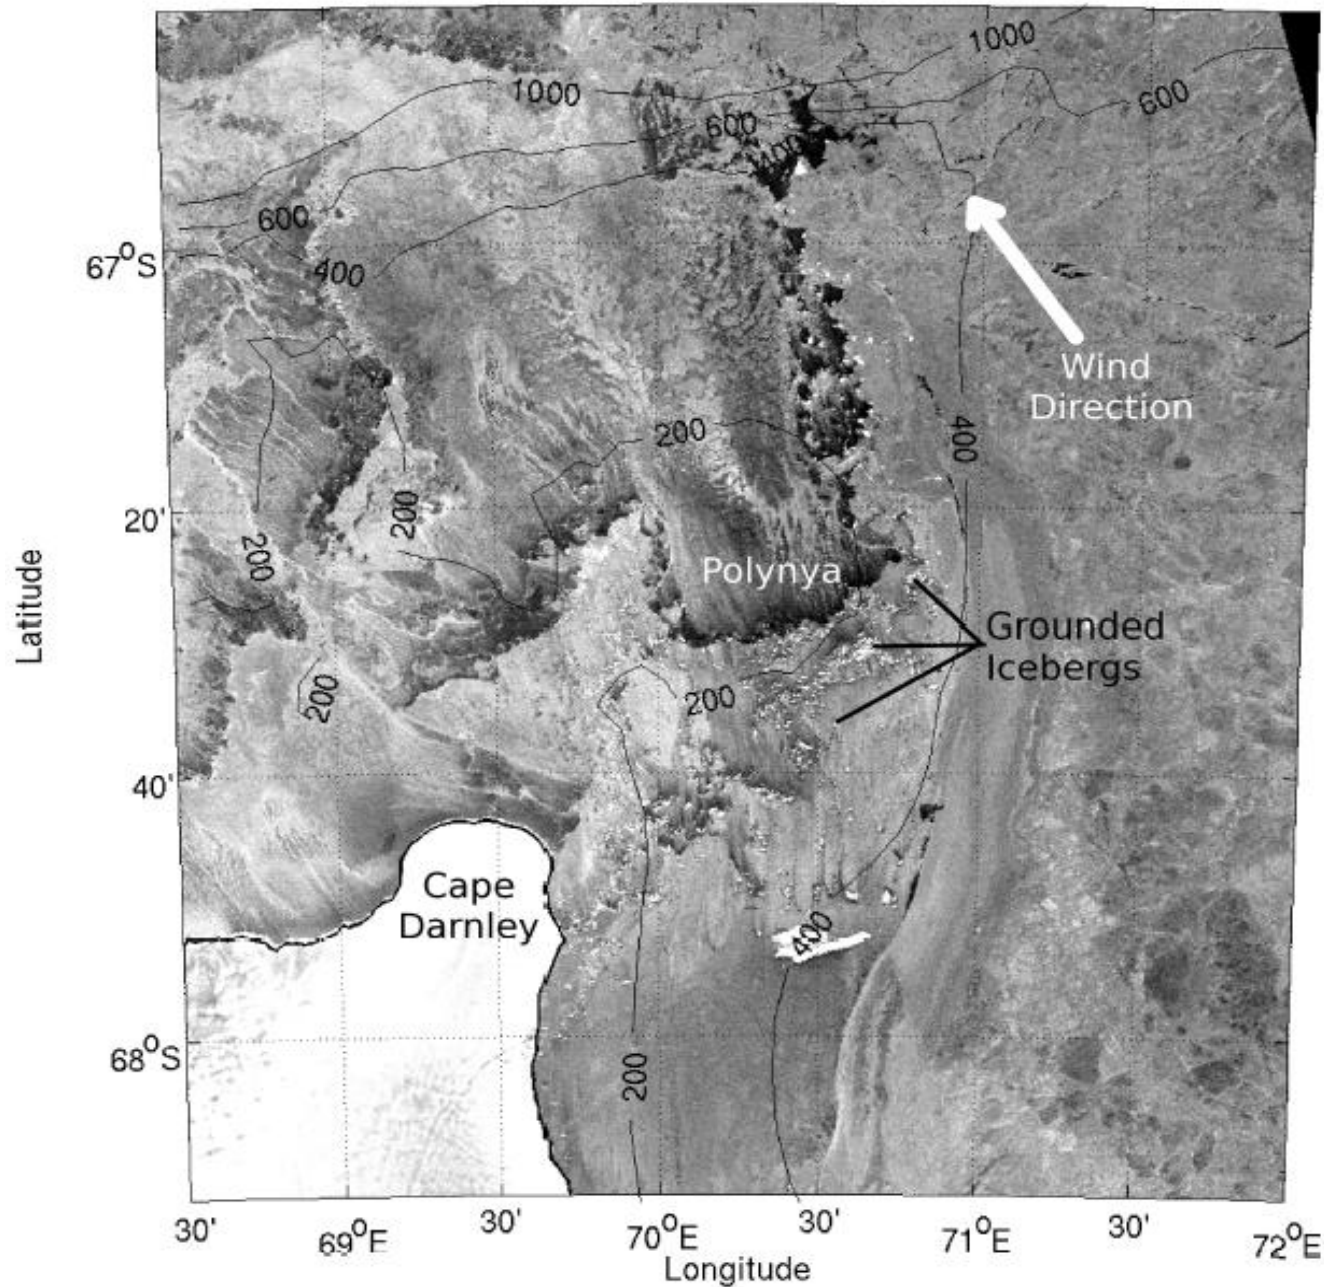

Jacobs 2004

AABW is freshening

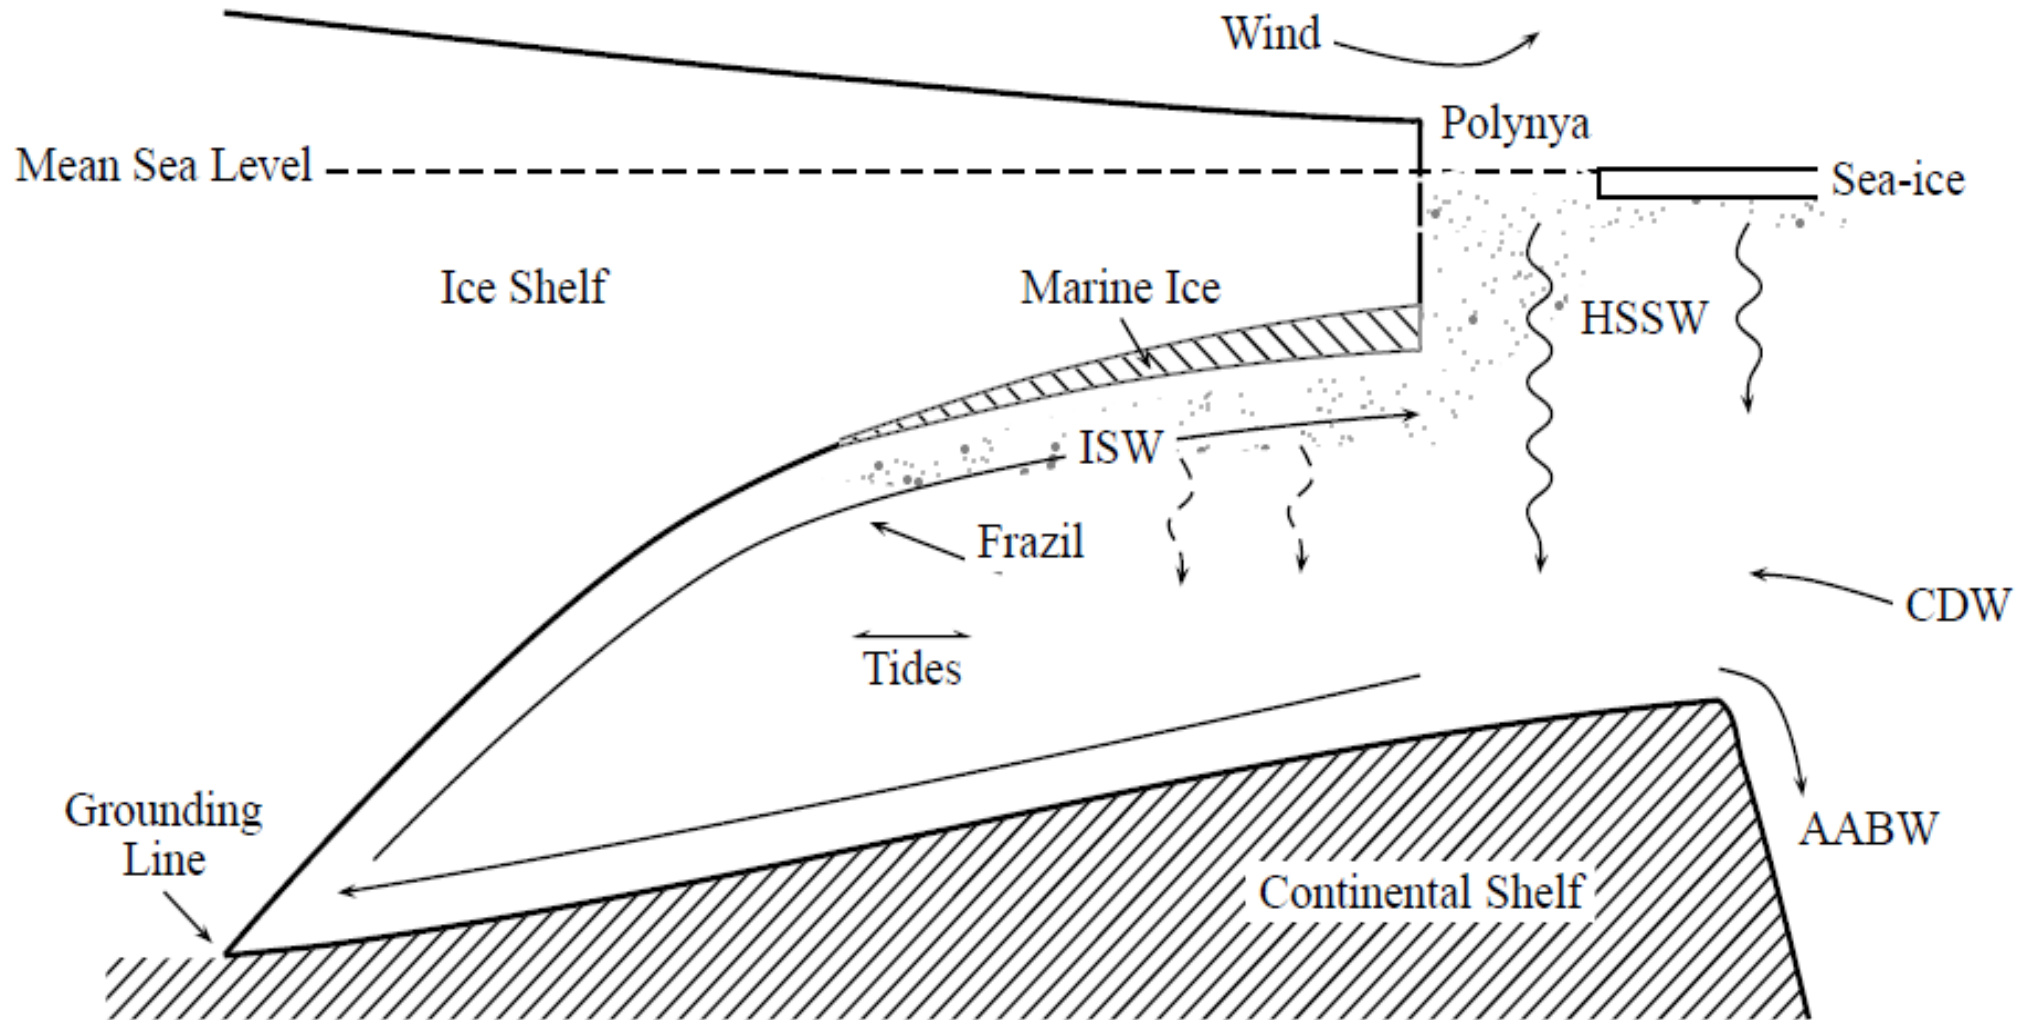

Rintoul 2007

Mechanisms of AABW formation: Polynyas and HSSW

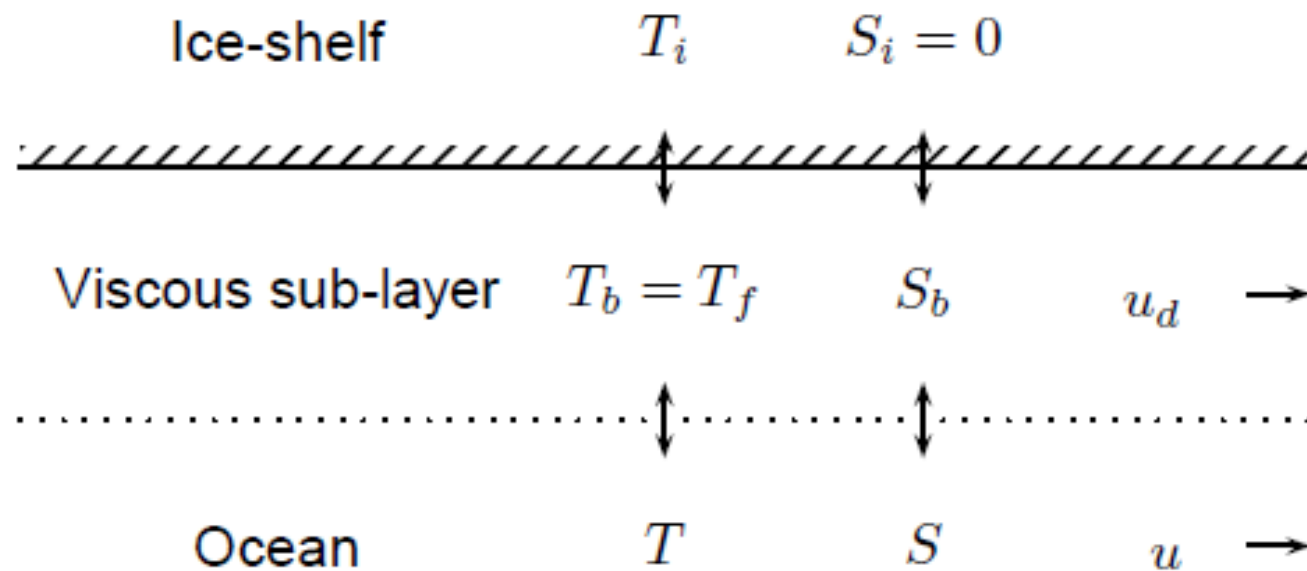

Ice-shelf/ocean interaction

Developing an ice shelf/ocean model

- Mechanical modifications: Adjustment of the surface pressure to account for the floating ice shelf (Already part of ROMS). Depth ranges from 300-2500m below mean sea level
- Thermodynamic modifications:
 - Direct basal ice-ocean interaction
 - Frazil ice dynamics
- Modified equation of state for larger range of θ (Jackett and McDougall 2006)

Basal ice-ocean boundary

$$\rho_i(L - c_i\Delta T)m = \rho c_w \gamma_T (T_b - T)$$

$$\rho_i S_b m = \rho \gamma_S (S_b - S)$$

$$T_f = -5.73 \times 10^{-2} S_b + 8.32 \times 10^{-2} + 7.61 \times 10^{-4} z_{ice}$$

Frazil modelling

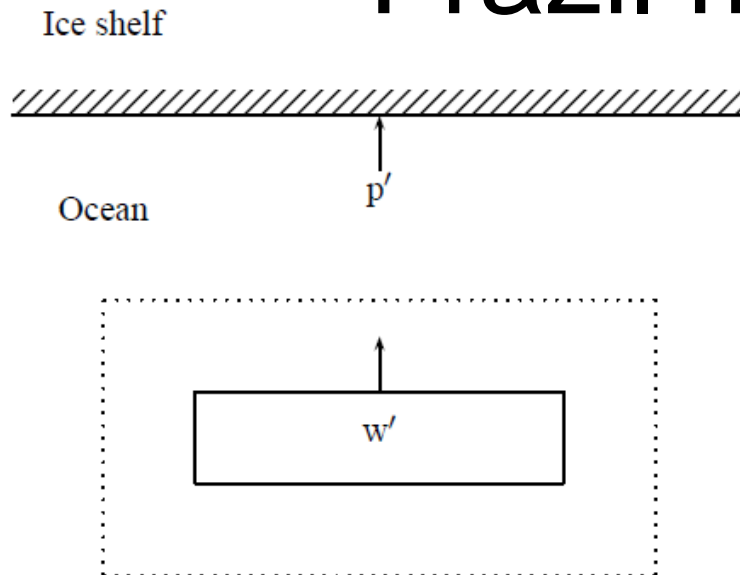

- Following implementation of sediment (Warner et al. 2005) solving advection-diffusion equation:

$$\underbrace{\frac{\partial C}{\partial t}}_{\text{Transient}} + \underbrace{\nabla \cdot (C \mathbf{v})}_{\text{Advection}} + \underbrace{w' \frac{\partial C}{\partial z}}_{\text{Buoyant rising}} = \underbrace{\nabla \cdot (K \nabla C)}_{\text{Mixing}} + \underbrace{S}_{\text{Source/Sink}}$$

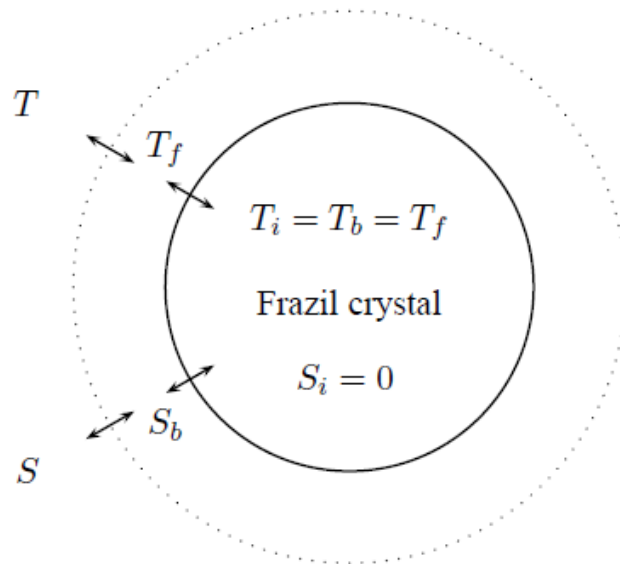

Frazil tracers are included in ROMS using hijacked sediment code. Modifications:

- Buoyant rising (Morse and Richards (2008))
- S = Primary and Secondary Nucleation, Precipitation, Melting/Freezing
- Modified equation of state to consider ice density

Frazil modelling

a) Elevation view

b) Plane view

$$\rho_i L f' = \rho c_w \gamma'_T \mathcal{A} (T_b - T)$$

$$\rho_i S_b f' = \rho \gamma'_S \mathcal{A} (S_b - S)$$

$$\gamma'_T = \frac{Nu k_T}{r a_r}$$

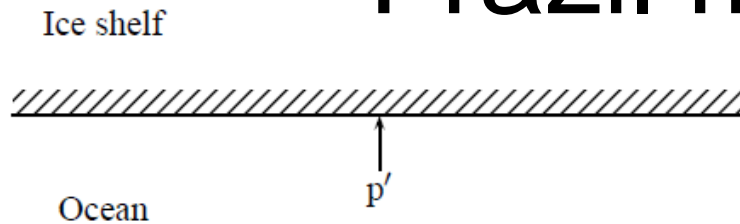

$$\gamma'_S = \frac{Sh k_S}{r a_r}$$

Nu = Nusselt number

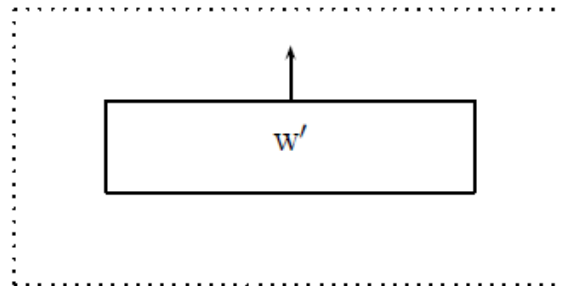

Sh = Sherwood number

Nu and Sh both scale with crystal size

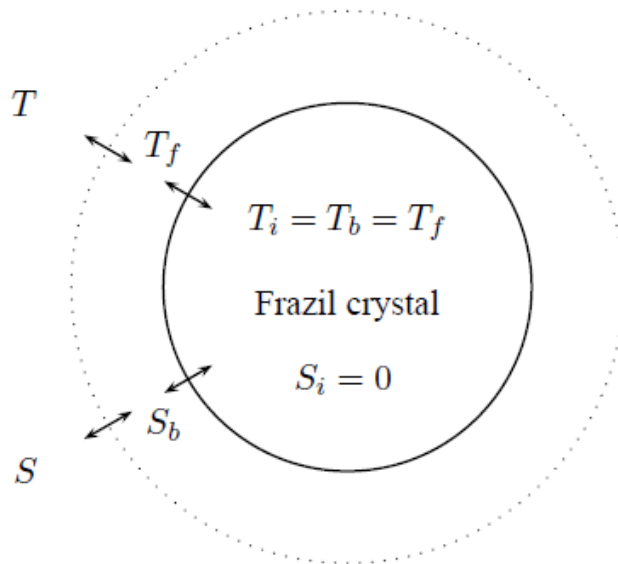

Frazil modelling

a) Elevation view

b) Plane view

$$\rho_i L f' = \rho c_w \gamma'_T \mathcal{A} (T_b - T)$$

~~$$\rho_i S_b f' = \rho \gamma'_S \mathcal{A} (S_b - S)$$~~

$$\gamma'_T = \frac{Nu k_T}{r a_r}$$

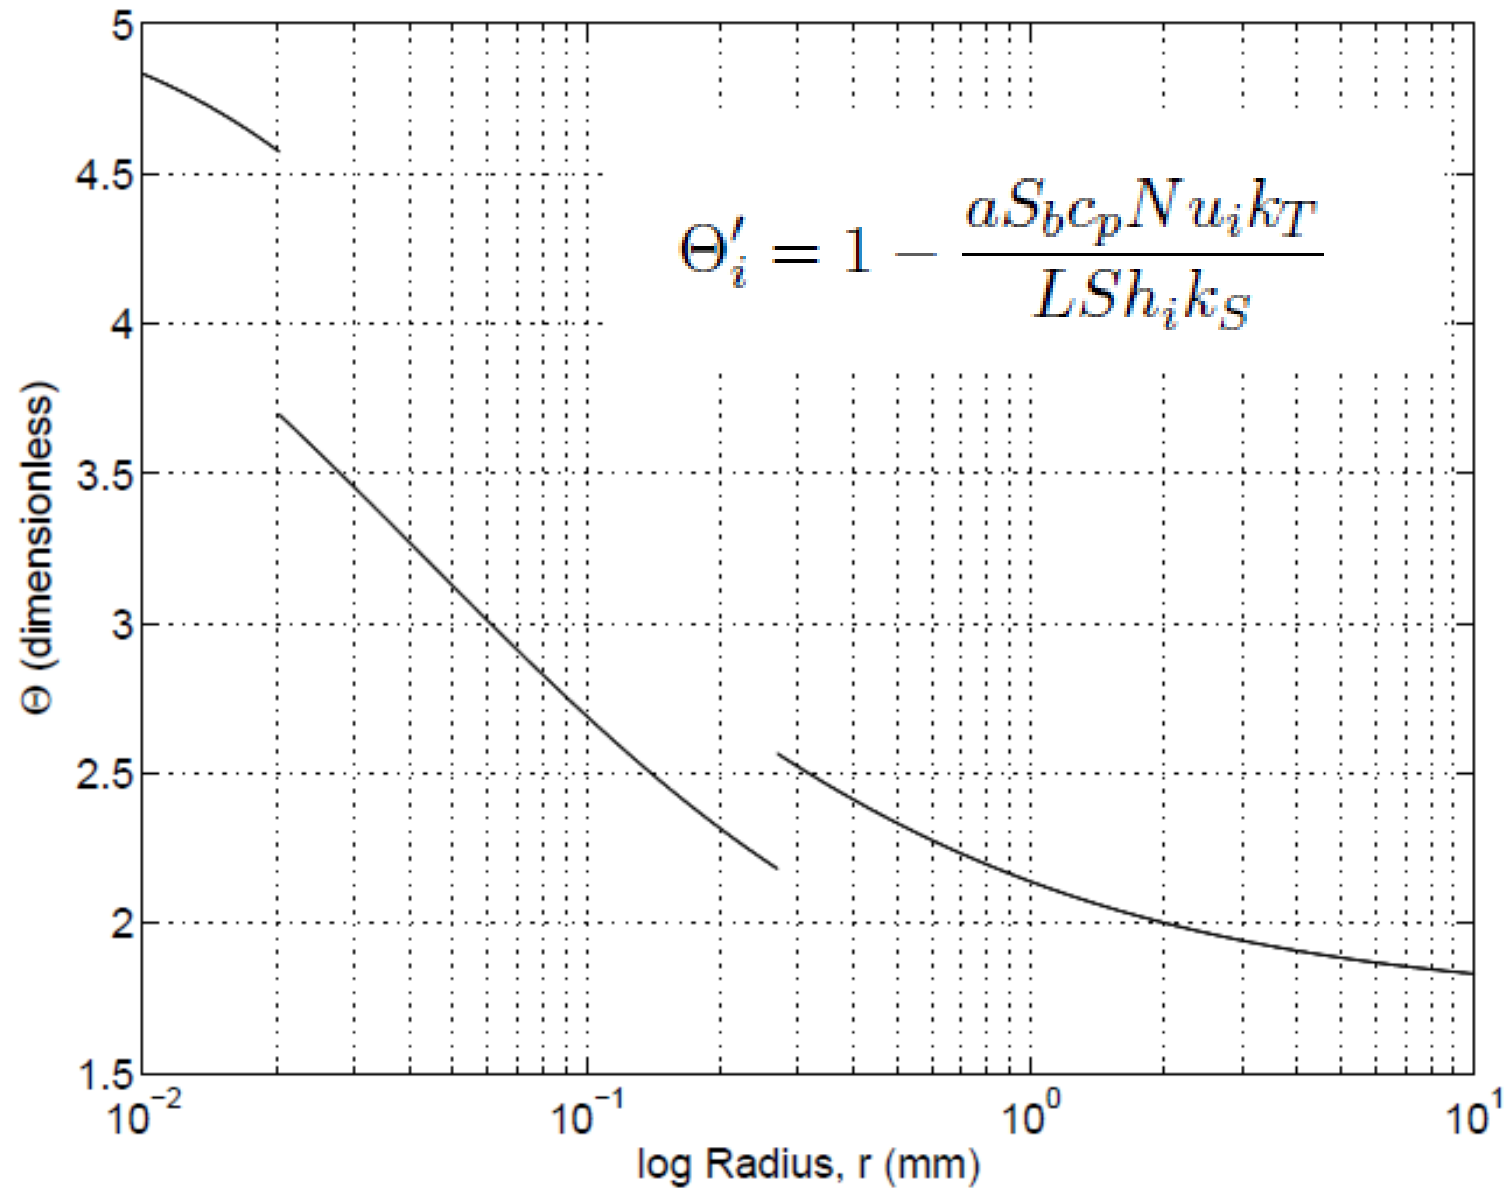

$$\gamma'_S = \frac{Sh k_S}{r a_r}$$

Nu = Nusselt number

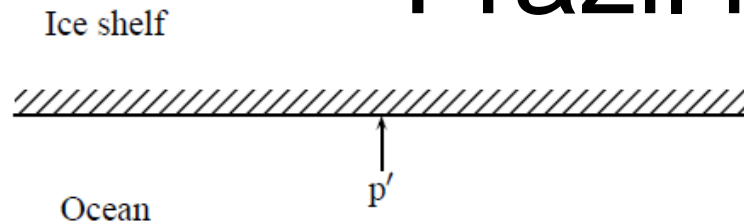

Sh = Sherwood number

Nu and Sh both scale with crystal size

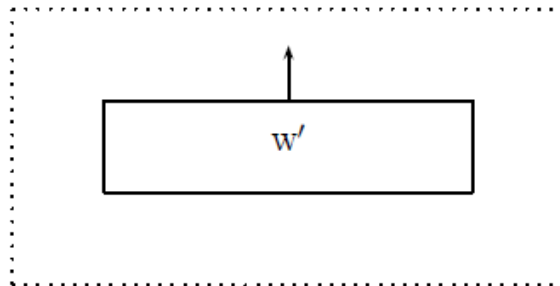

Scaling Factor

Frazil modelling

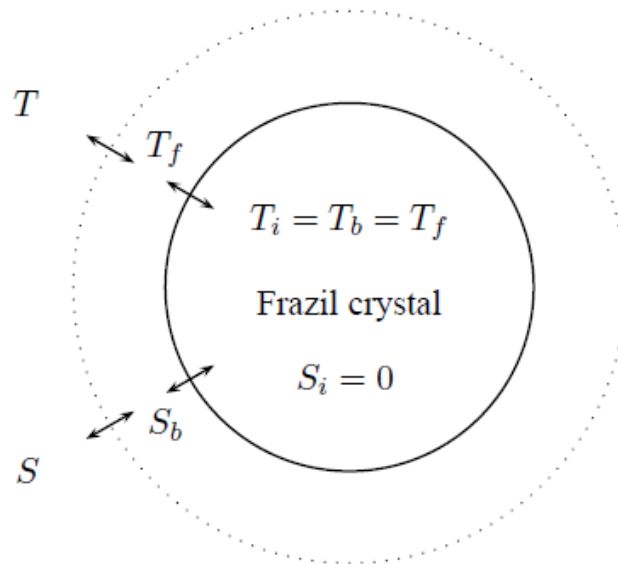

a) Elevation view

$$G_i = \frac{c_p N u_i k_t}{L \Theta'_i} (T_f - T) \frac{2}{r_i^2} C_i$$

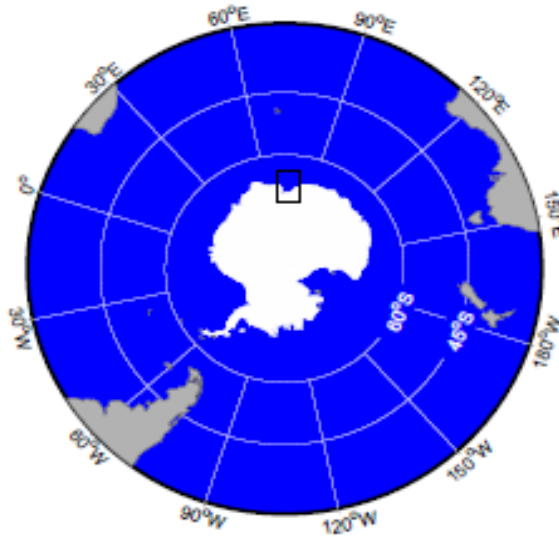

$$M_i = \frac{c_p N u_i k_t}{L \Theta'_i} (T_f - T) \frac{2}{r_i} \left(\frac{1}{r_i} + \frac{1}{2a_r r_i} \right) C_i$$

Jenkins and Bombosch (1995) and
Holland and Feltham (2005)

The Amery Ice Shelf Ocean Model

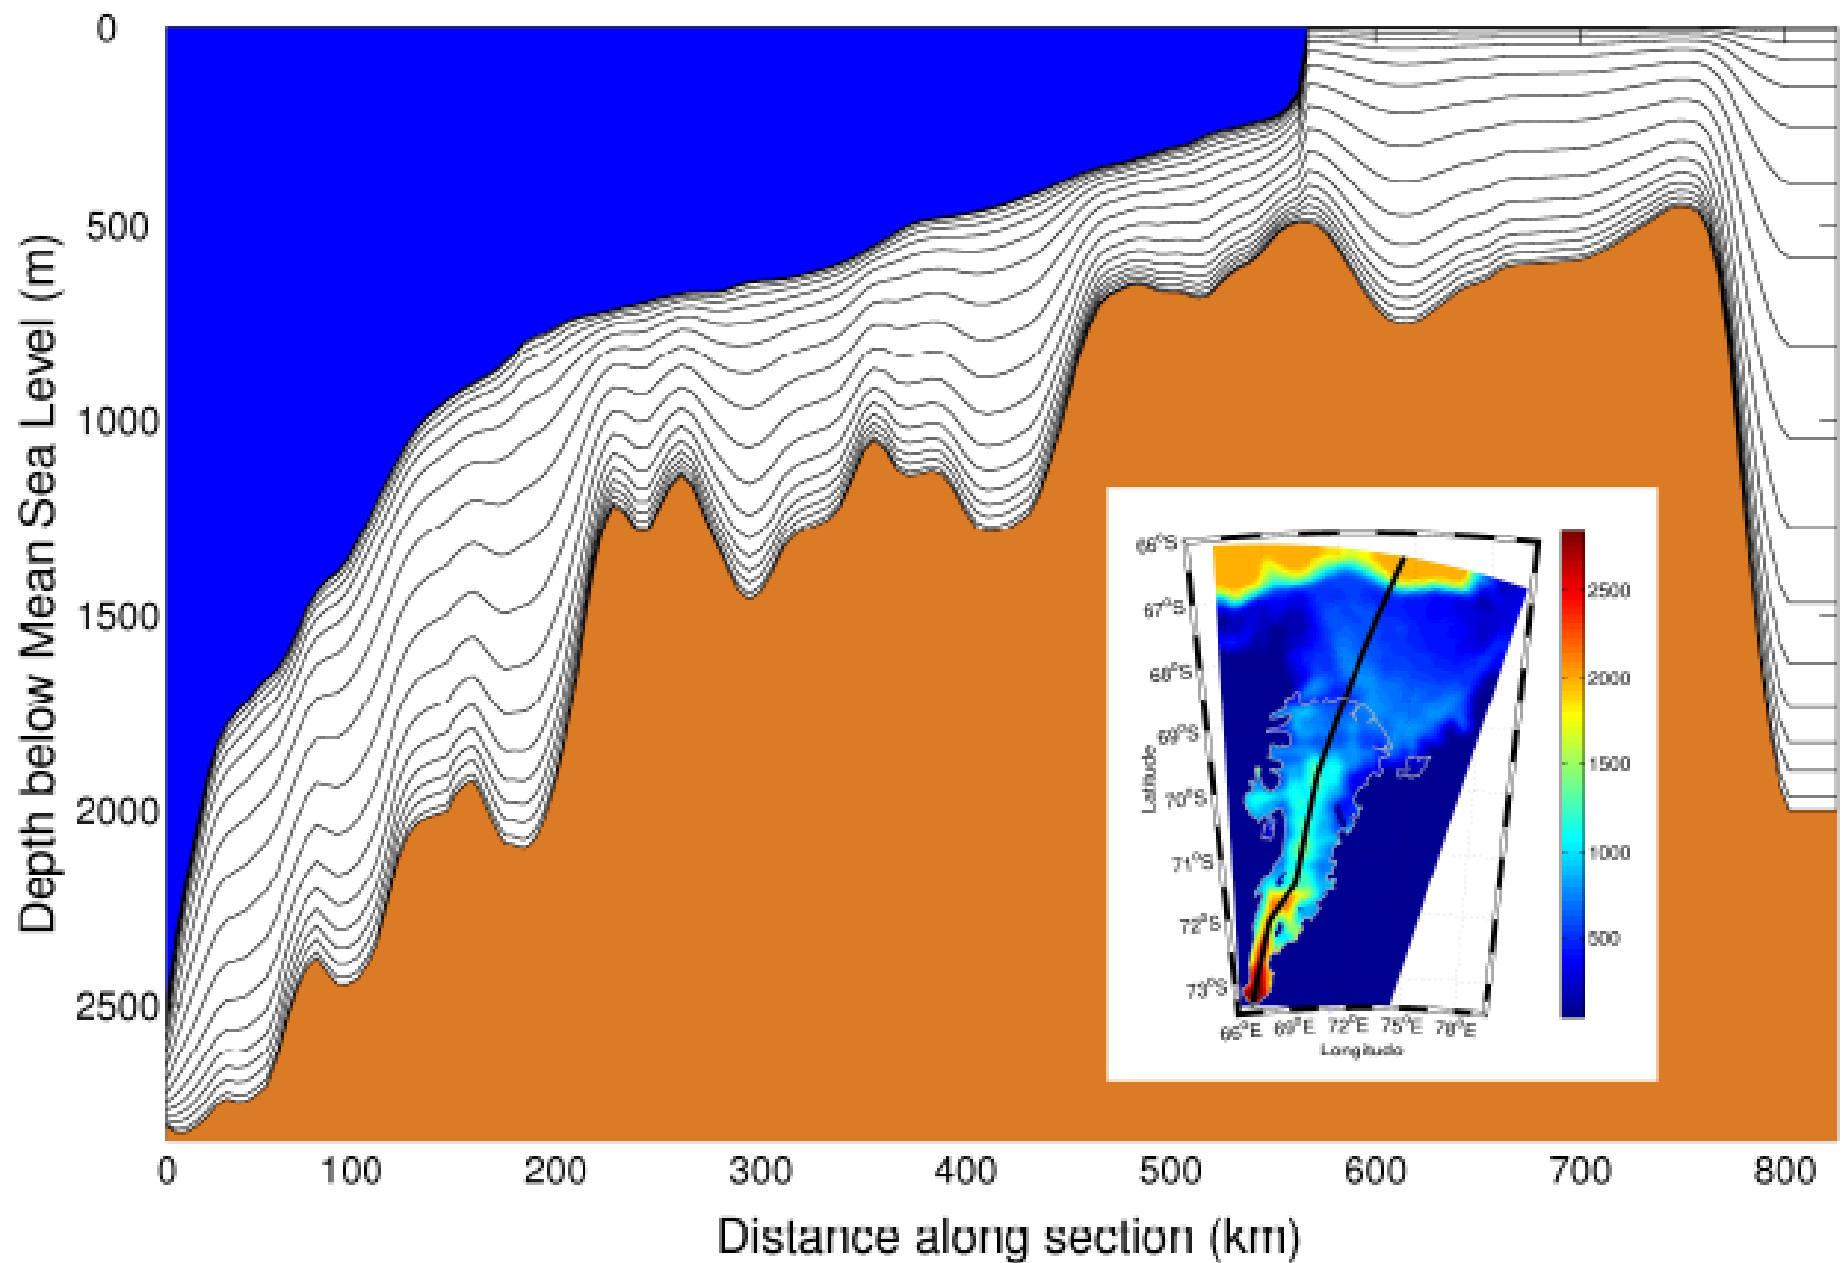

- Based on the Rutgers version of ROMS: Regional Ocean Modeling System (Hernan Arango)
- Shchepetkin and McWilliams (2005)

The Amery Ice Shelf Ocean Model

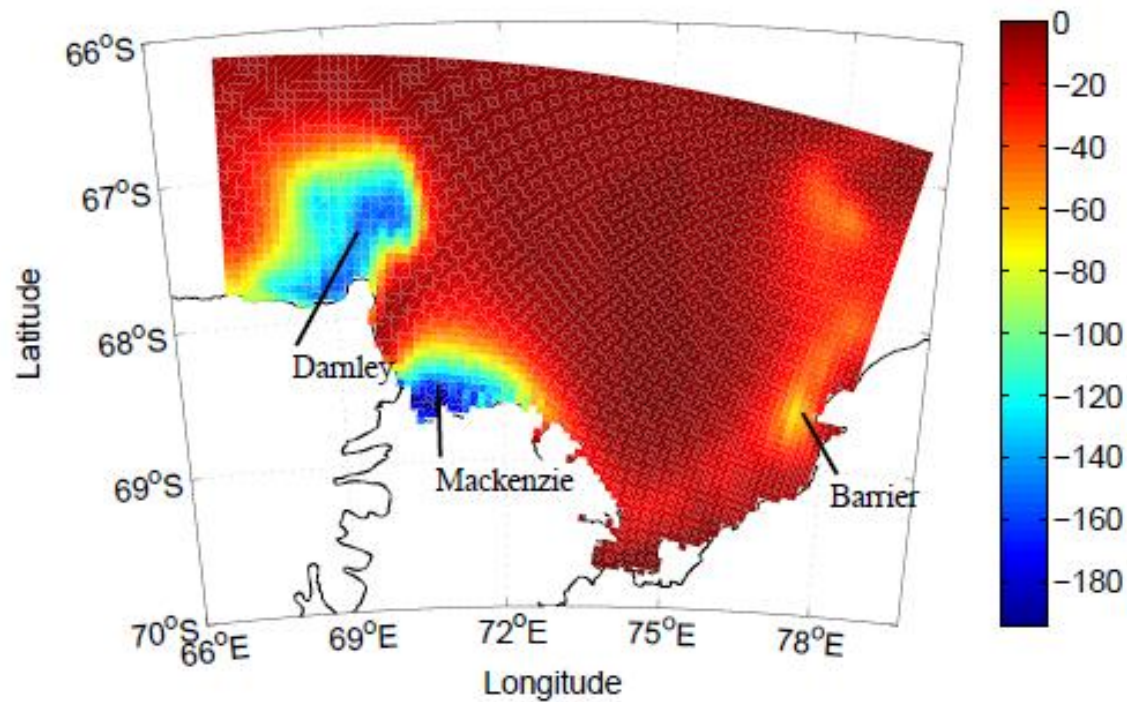

- Time stepping: 600 seconds on baroclinic and 20 seconds on barotropic
- Run time 1 week on 16 cpus (Computationally intensive)
- 60 % longer using 5 frazil size classes
- Geometry: Galton-Fenzi and others (2008)

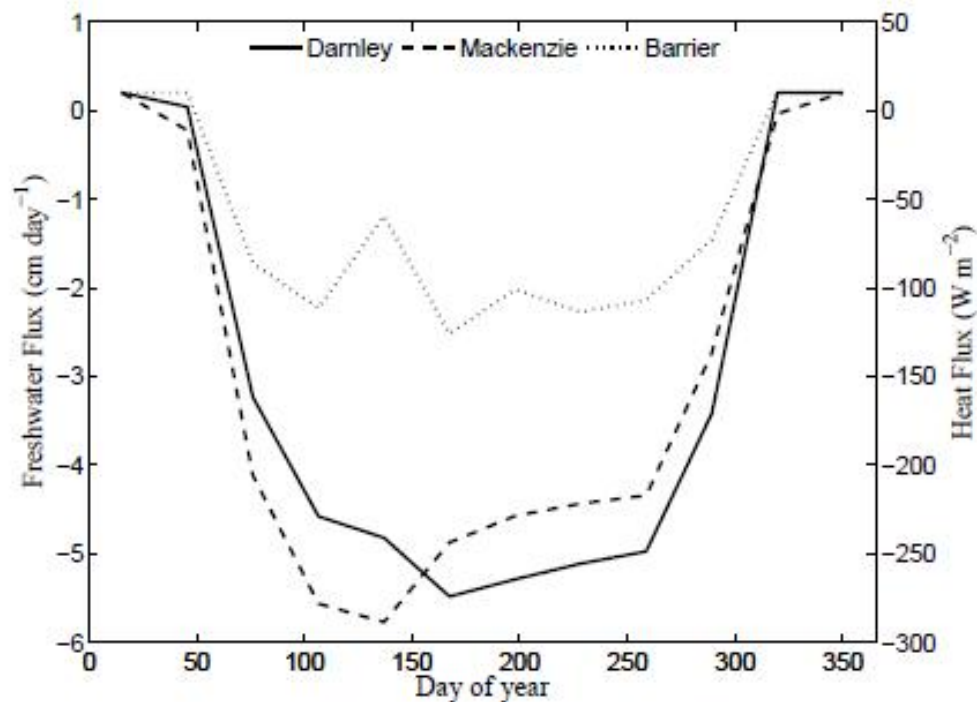

- 171x83 Horizontal grid cells. 16 Vertical layers. Polar grid \sim 2 to 5 km

Forcing

- Following Dinniman and others (2007) JGR:
 - Imposed sea ice from Tamura (2007). Heat and salt fluxes computed from thermodynamic calculation of ice freezing or melting, but ice is not accumulated or transported
 - Daily wind stress and wind speed from NCEP2 reanalysis, which compares well with available AWS observations
- Tidal forcing – TPXO6.2
- Lateral boundaries forcing with climatology from ECCO2 global model.

Polynyas in the region:

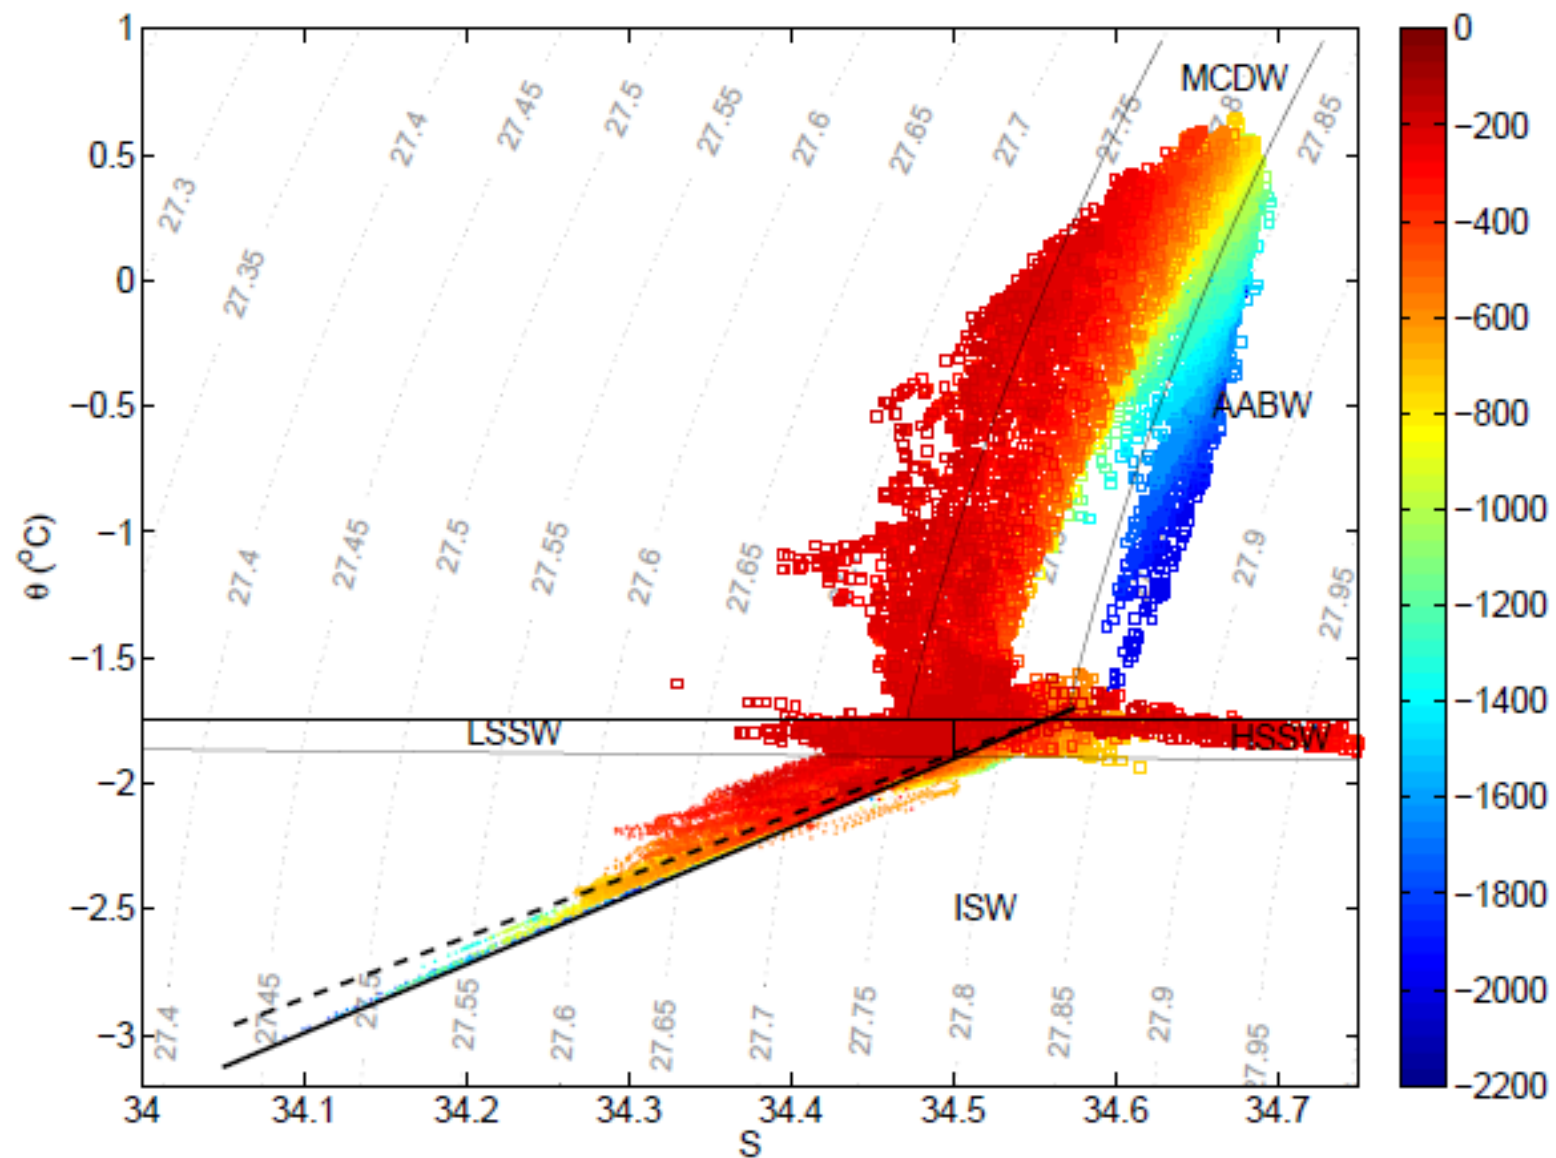

A source of AABW (?)

Tamura (2007)

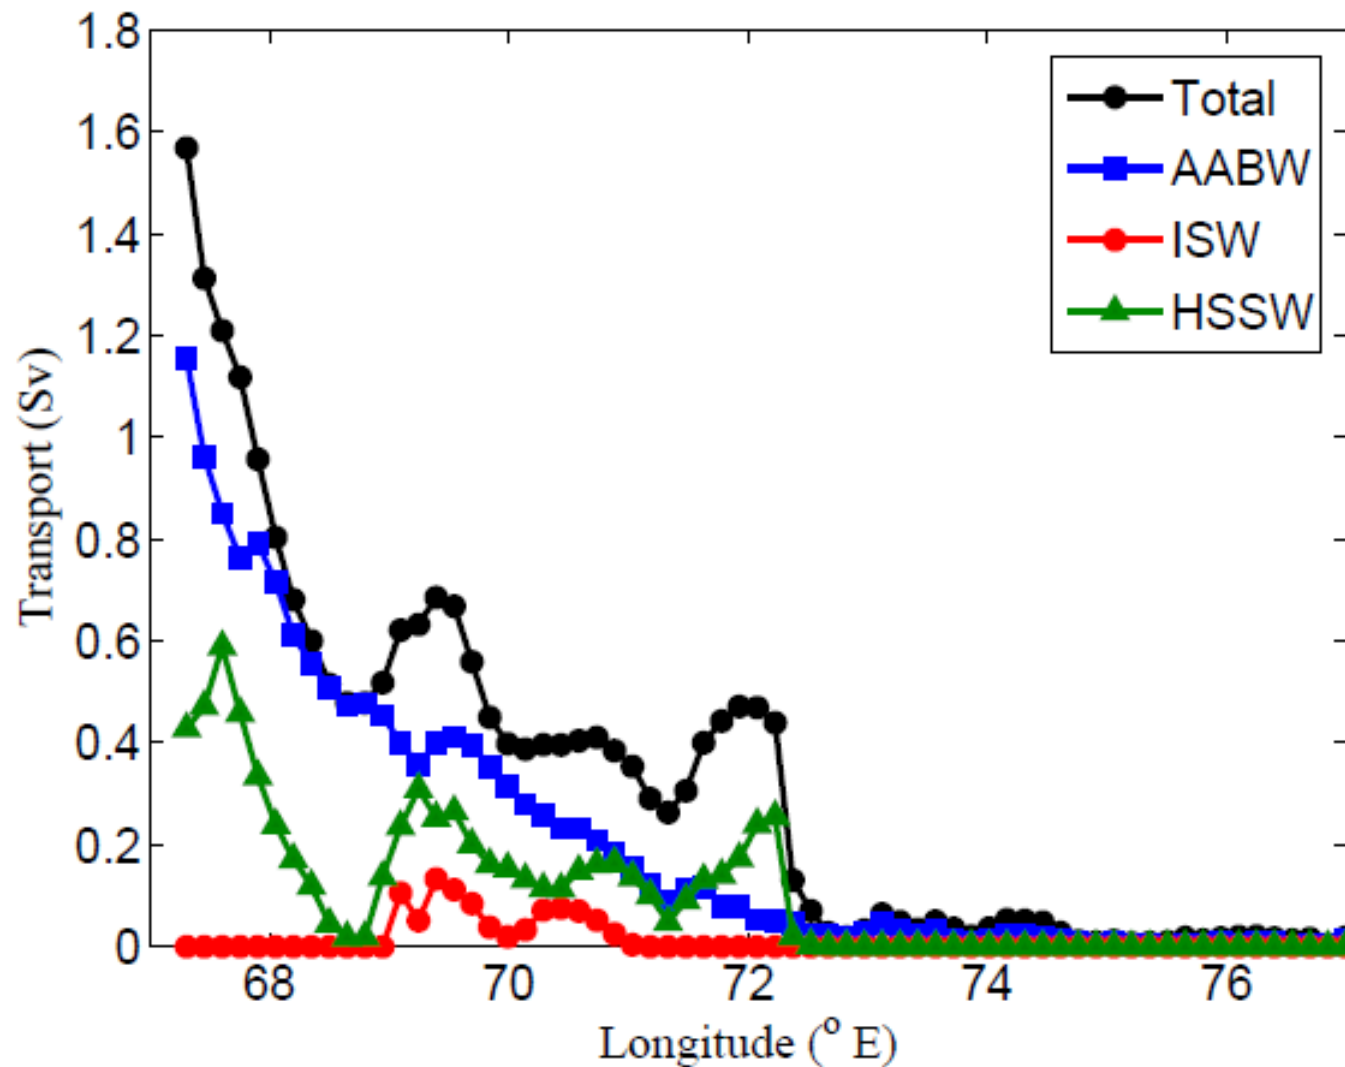

Mechanisms of AABW formation: Polynyas and HSSW

AABW formation

AABW formation

Observations suggest ~ 1 Sv in the vicinity of the Amery (Meijers et al. 2009)

Seasonal variability

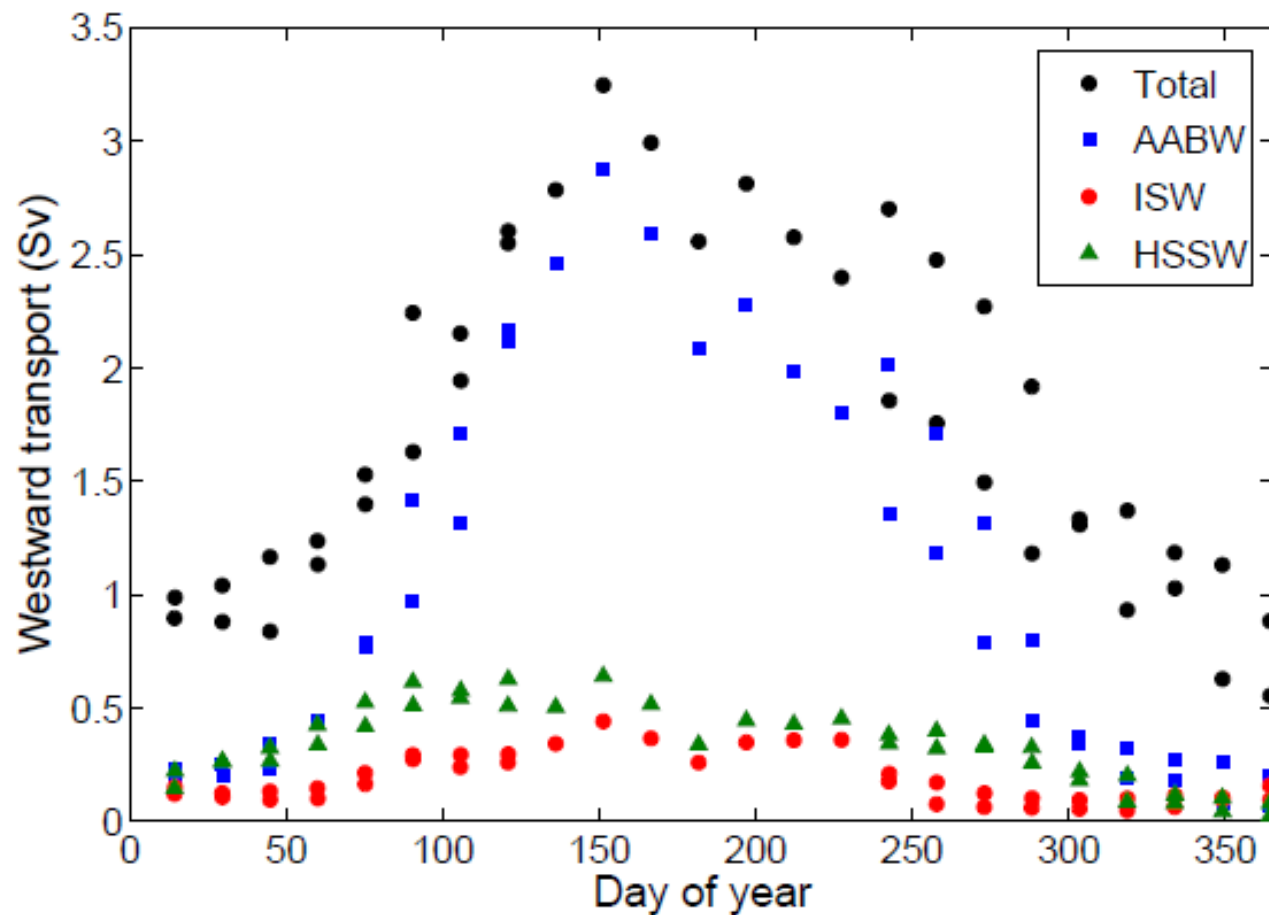

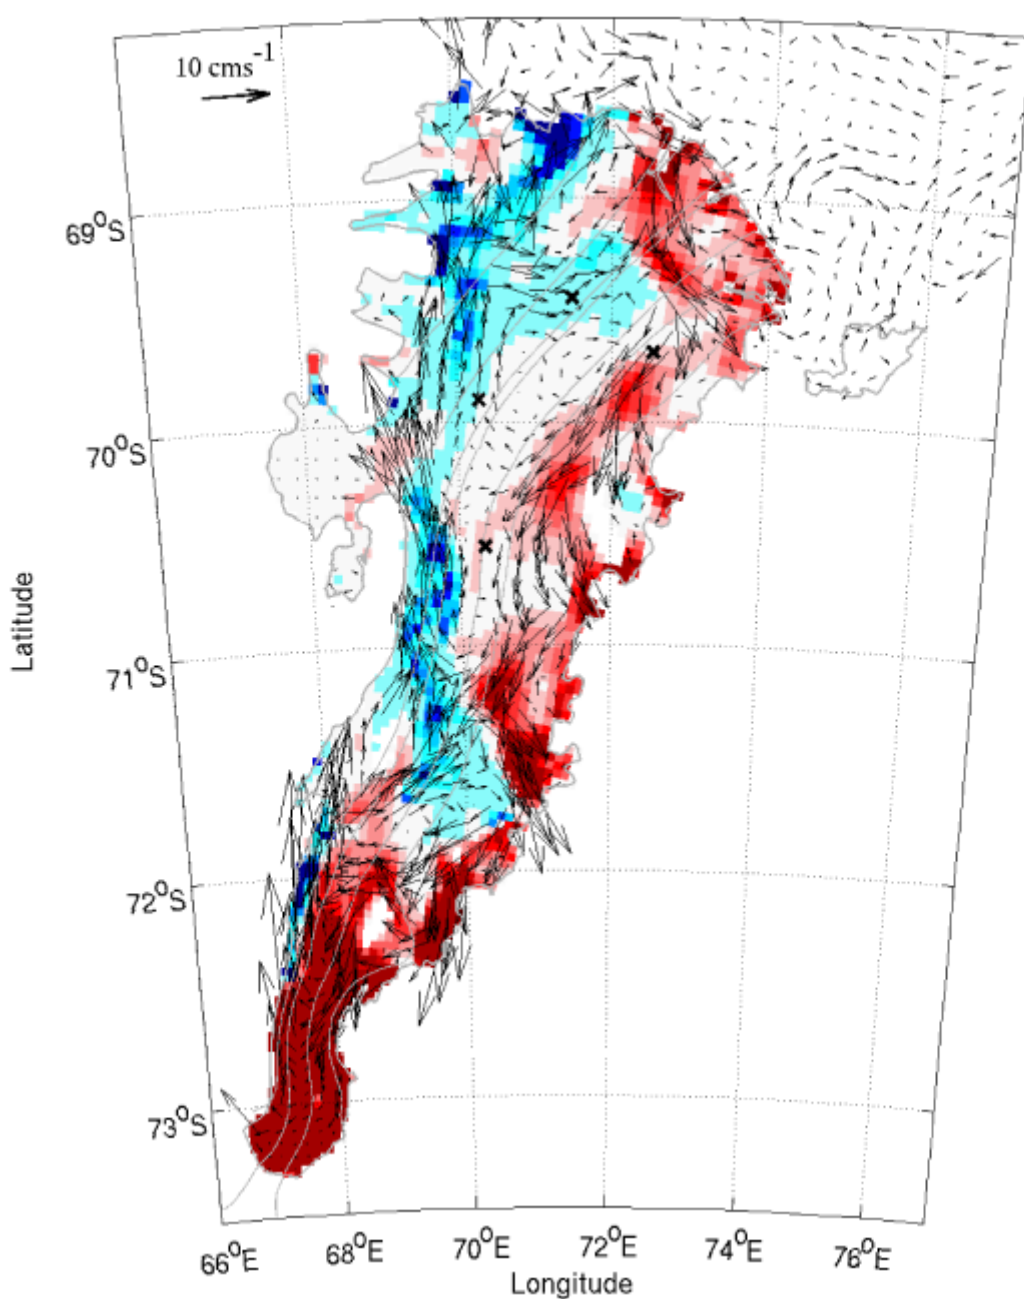

Figure 6.17: The annual-averaged westward transport (sv) of watermasses on the continental slope, for AABW (blue), ISW (red), HSSW (green) and the Total (black).

Melt (+ve)/Freeze (m/year) and depth averaged currents

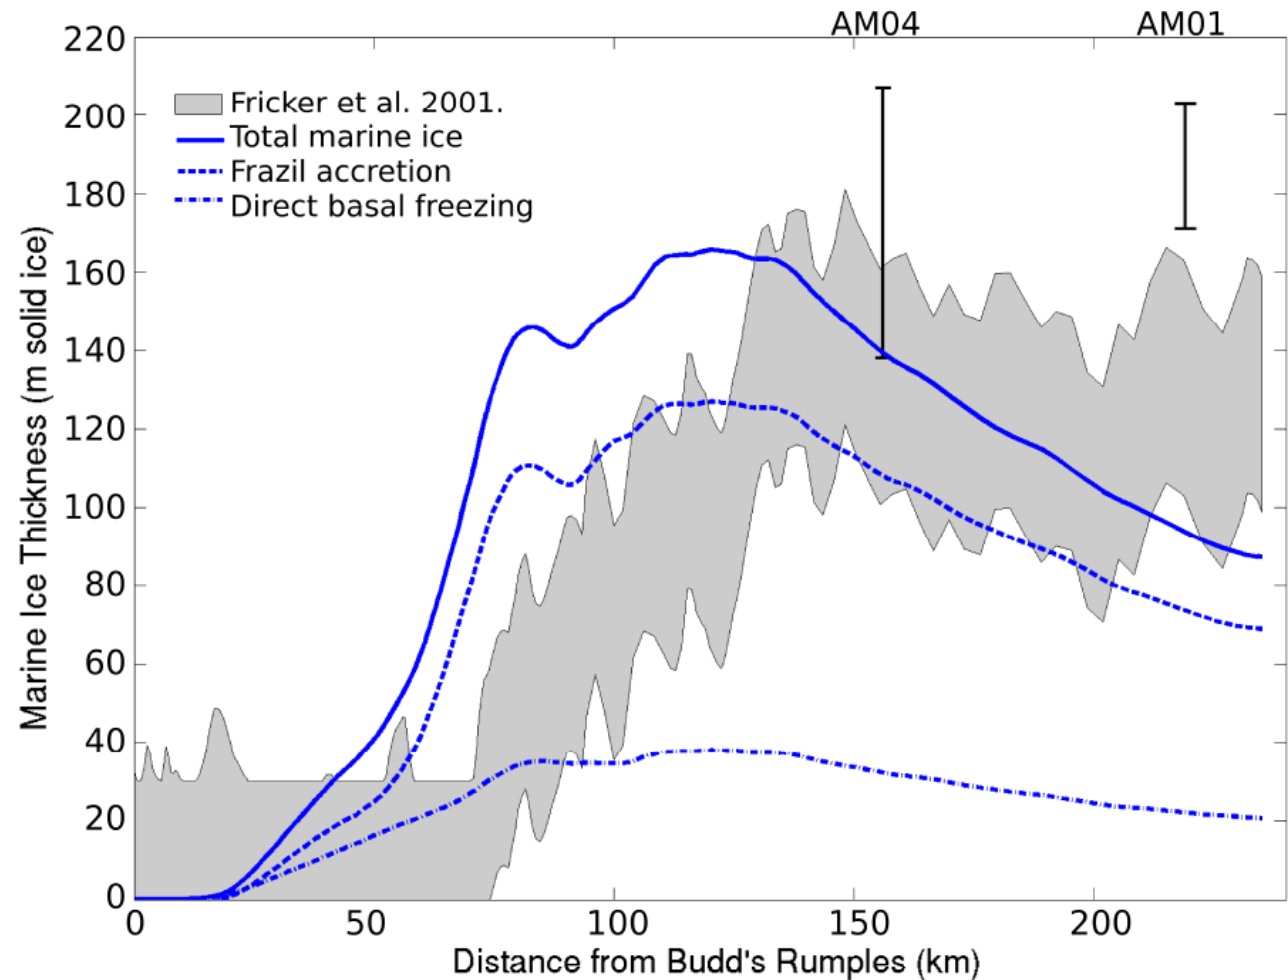

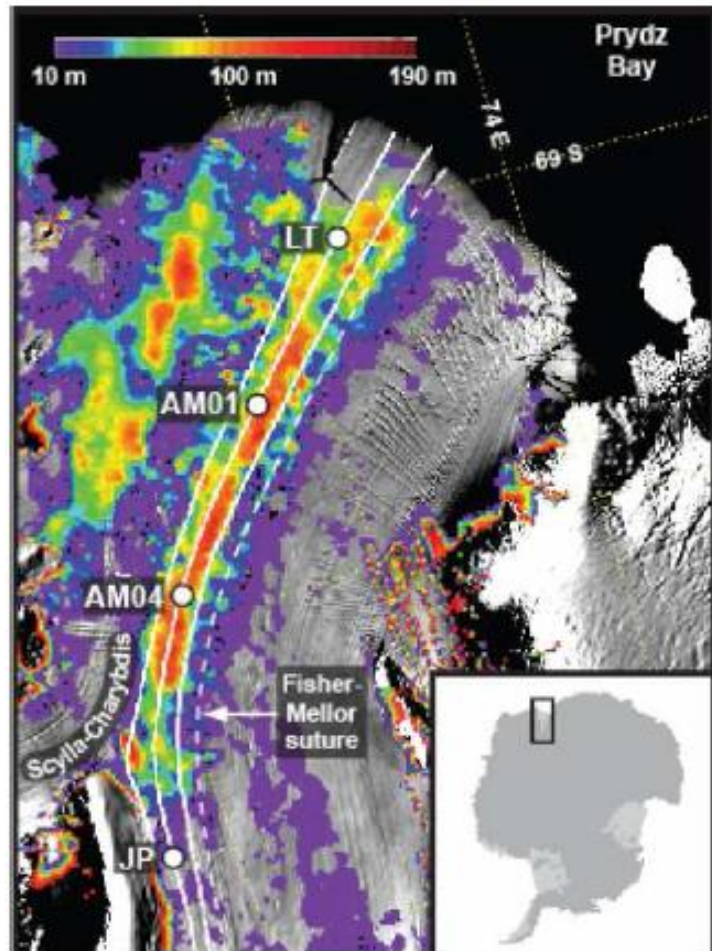

Model:

- Melting: ~50 Gt/year
- Refreezing: ~ 5.3 Gt/year
- Net: ~ 45 Gt/year
- Frazil accretion: ~70 %

Observations:

- Net melt: 55.6 \pm 12.6 Gt/year
- Glaciers: 88.9 \pm 9 Gt/year
Wen et al. (2008)
- Accumulation: 11.3 \pm 0.7 Gt/year
Arthern et al. (2006)
- Calving: 44.6 \pm 9.3 Gt/year

Marine Ice Accretion

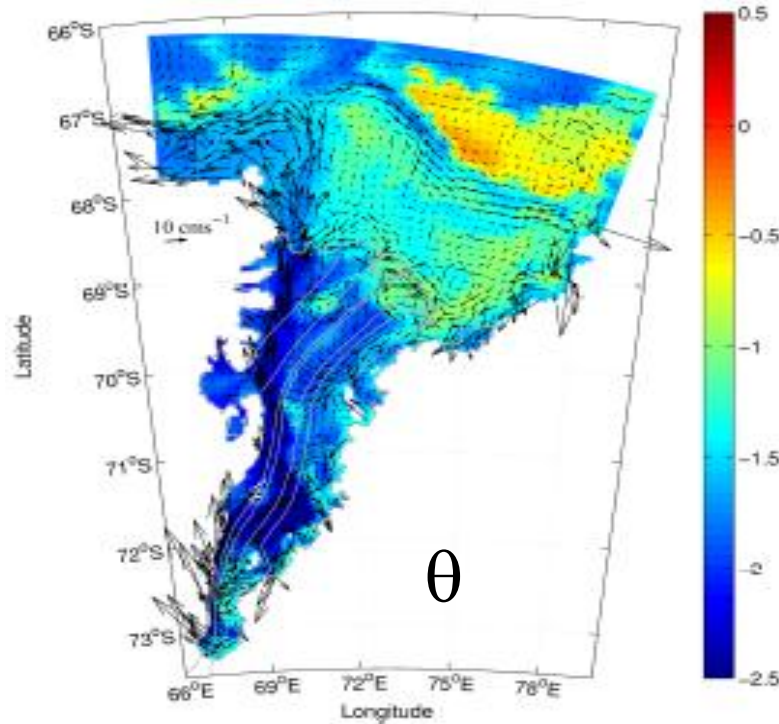

With and without frazil model

Table 6.5: Model estimates of the various basal mass balance components for the AIS. Net = Melt-Freeze (Gt year^{-1}). The total refreezing for the reference experiment is comprised of $1.64 \text{ Gt year}^{-1}$ of direct basal refreezing and $3.62 \text{ Gt year}^{-1}$ of frazil accretion.)

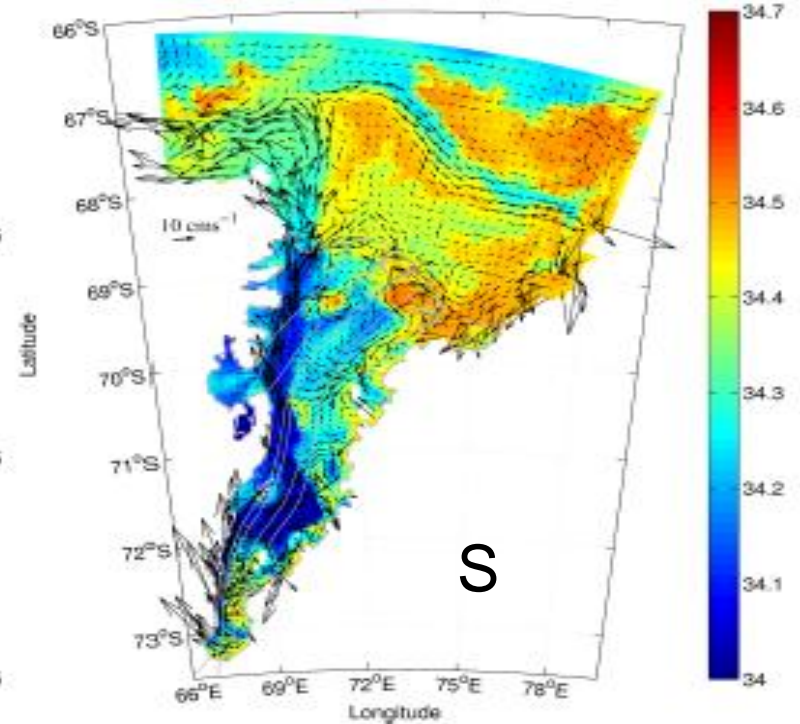

Model	Net	Melt	Freeze
Reference	45.63	50.89	5.26
Without Frazil	50.9	52.97	2.07
Glaciological Observations	55.6 ± 12.6	61.6 ± 12.6	$\sim 6^\dagger$

Sensitivity of AABW to melt water

Response to Climate Change

Air-Sea flux change (%)	Lateral warming (°C)			
	0	0.25	0.5	1
0	R	L1	L2	L3
-10	A1	+0.5		
-20	A2		+1	
-40	A3			+2

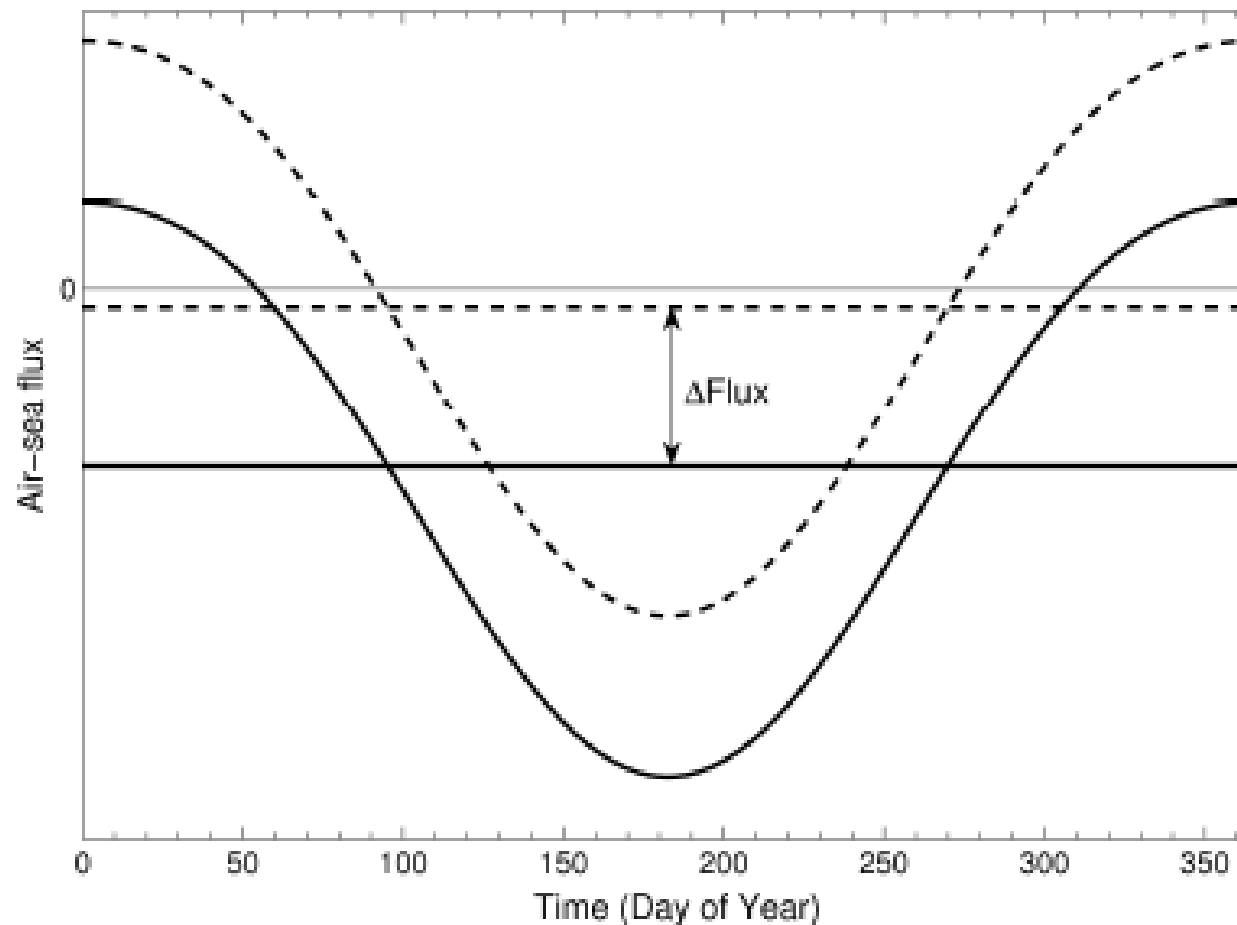

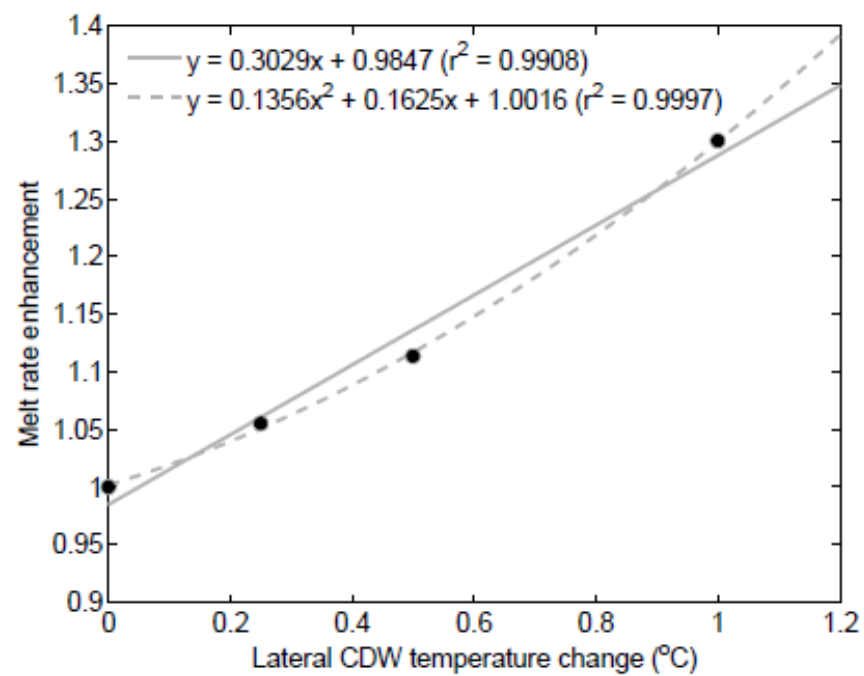

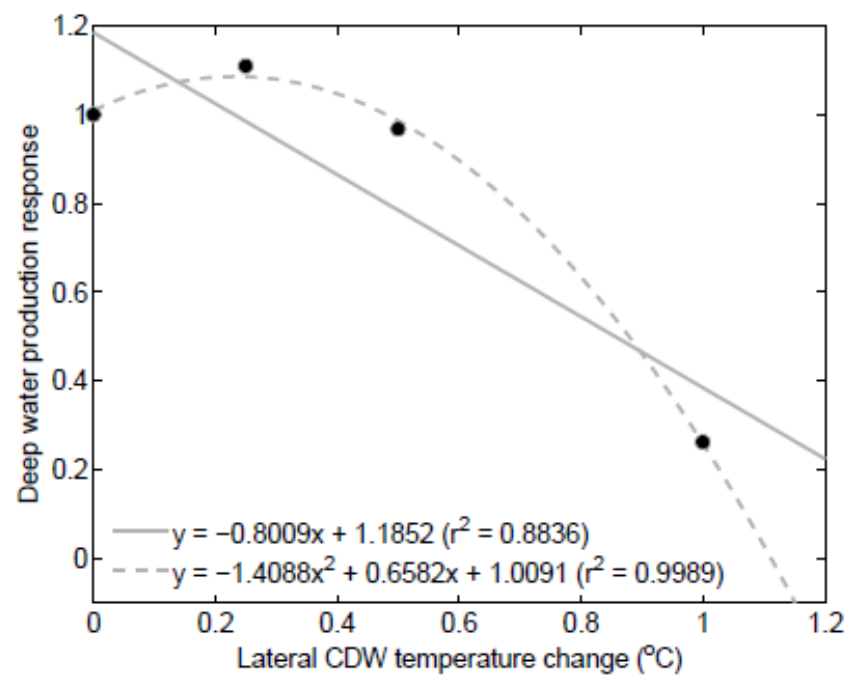

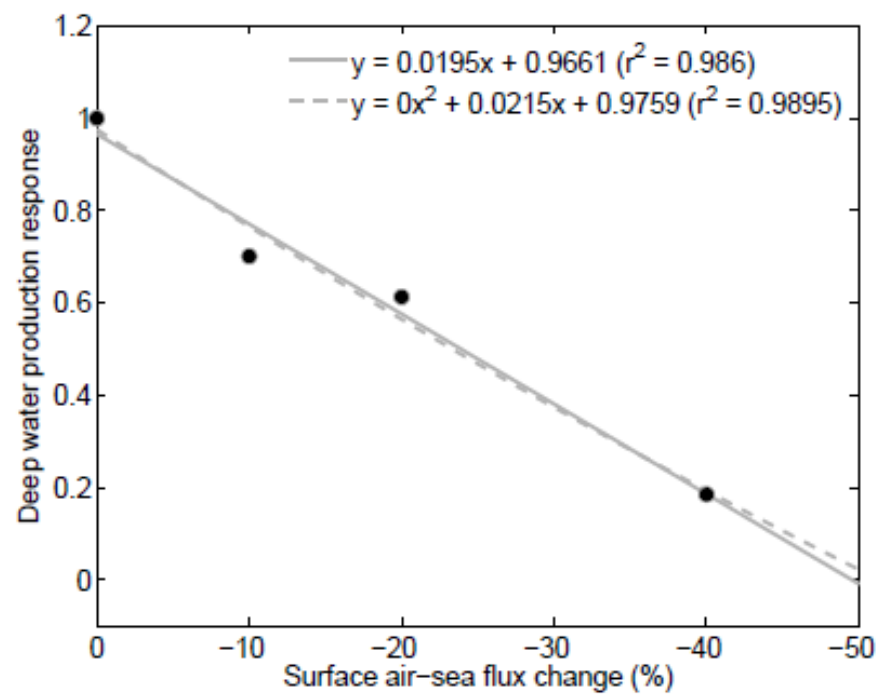

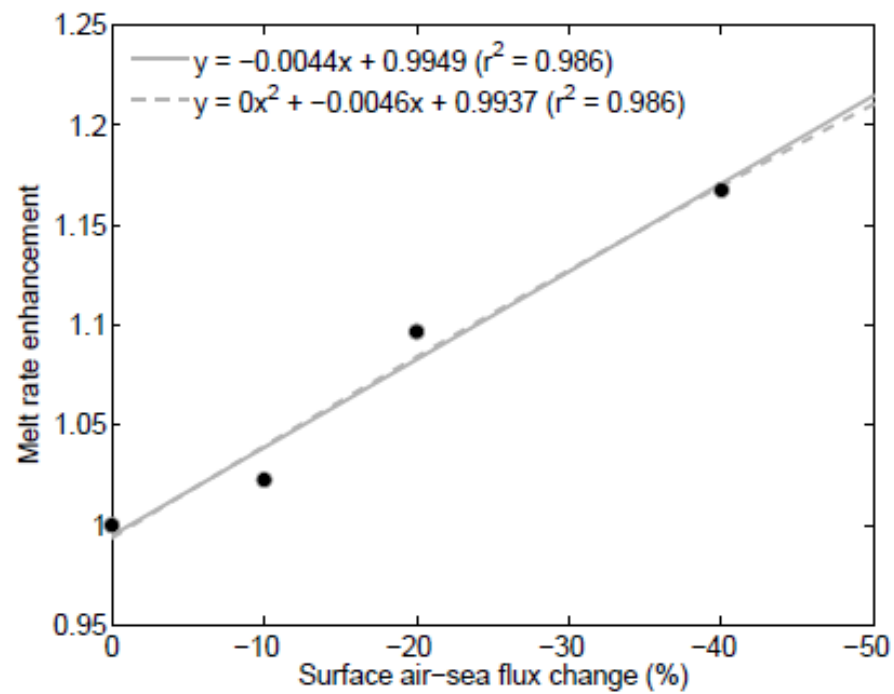

Figure 7.1: Idealised seasonal cycles of either heat and/or freshwater air-sea fluxes in the Southern Hemisphere. The change in surface air-sea fluxes (ΔFlux) is applied to the annual mean. The mean is calculated separately for each grid cell

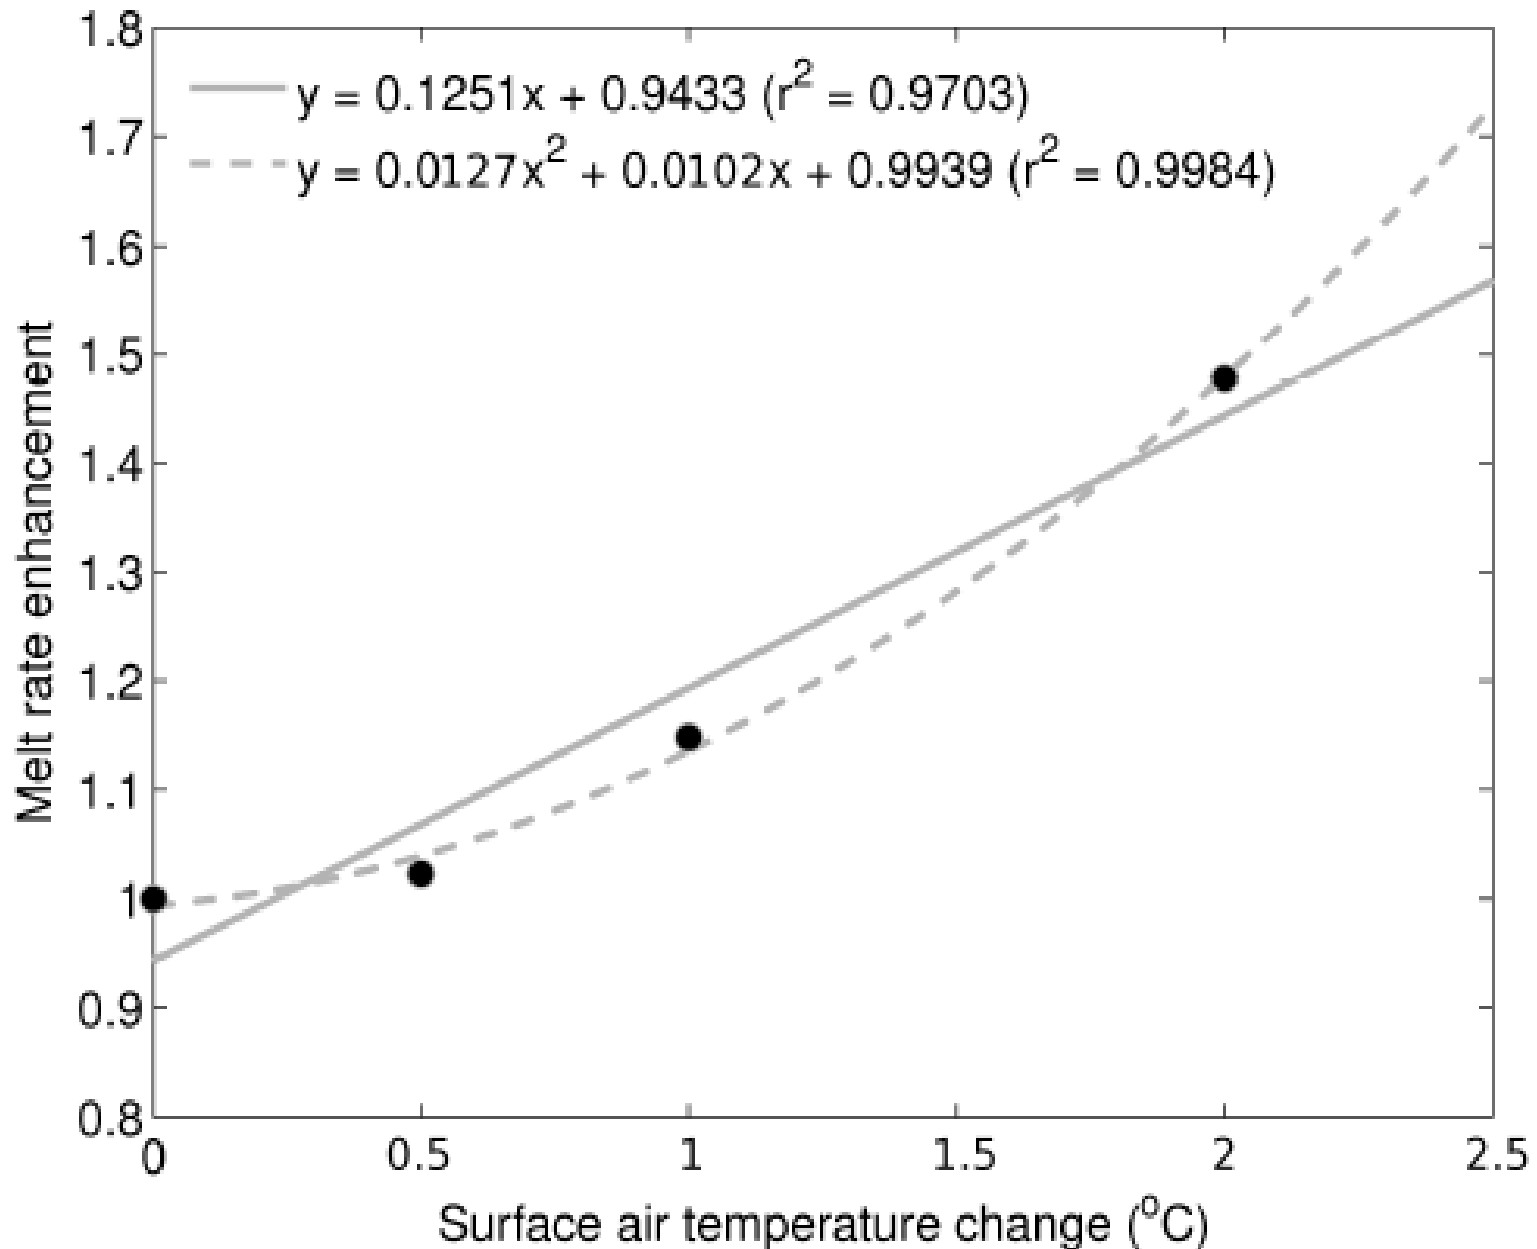

(a)

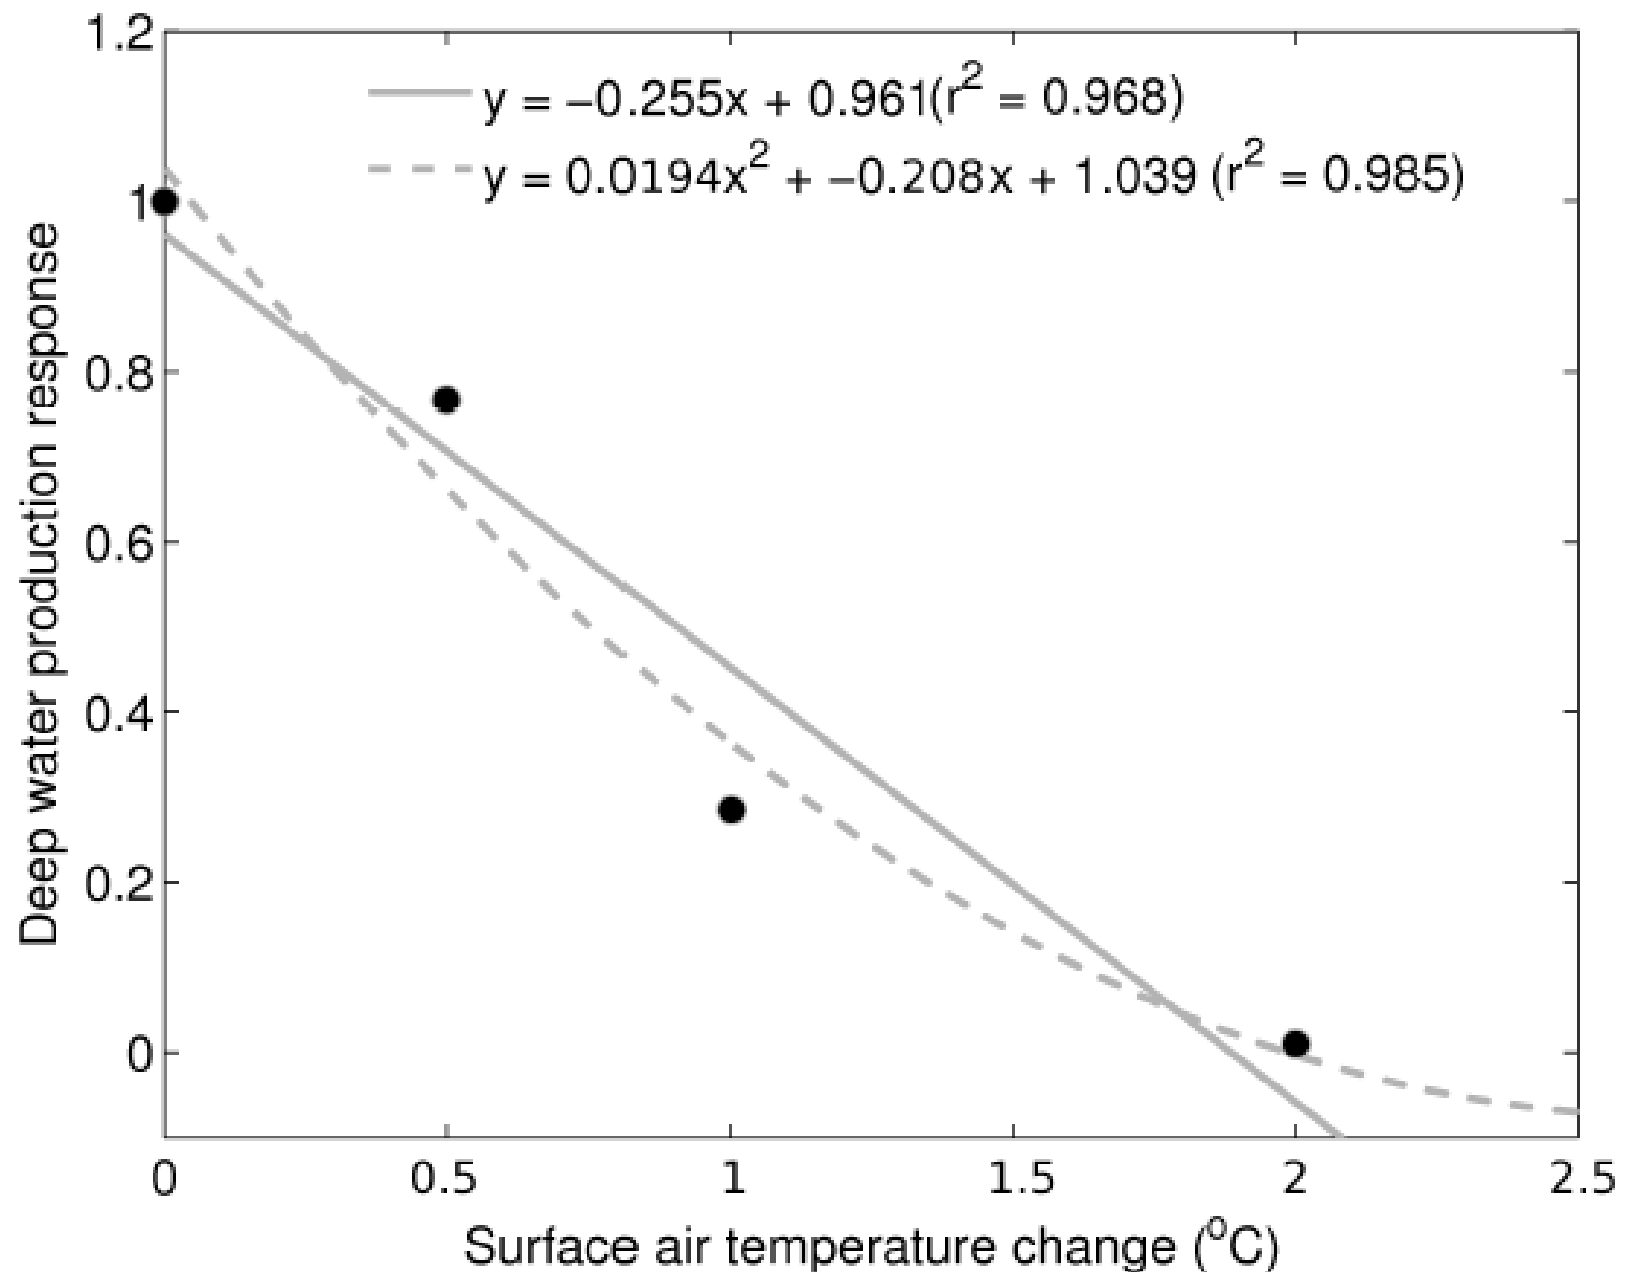

(b)

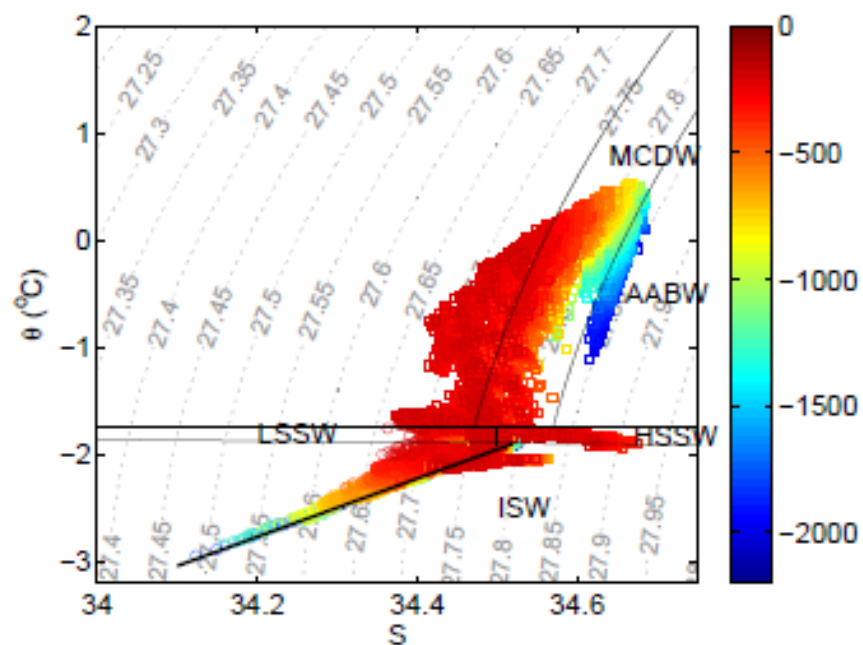

Enhanced basal melting of ice sheets

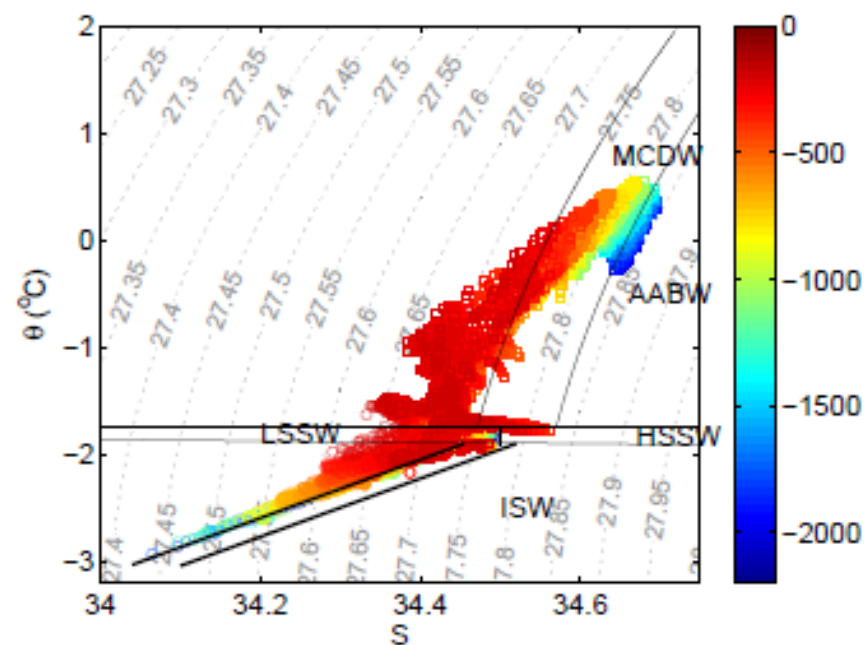

Shutdown of AABW at +2°C

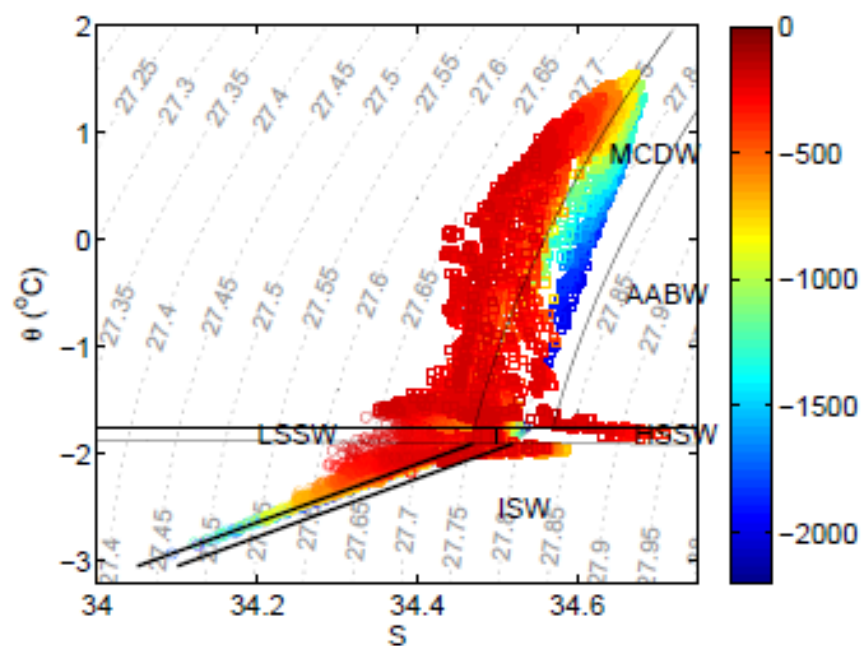

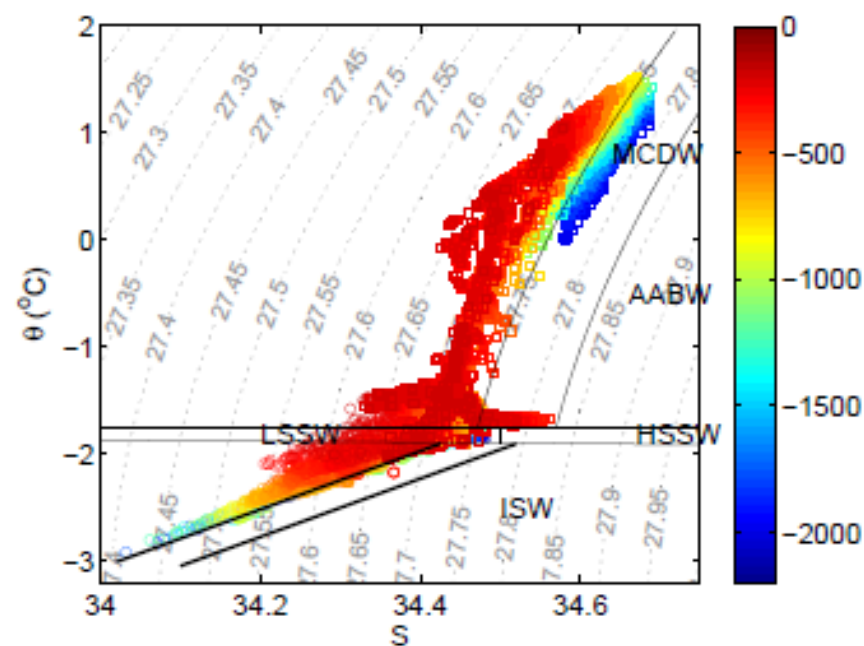

(a) Reference

(b) Air-sea: -40 %

(c) Lateral warming: 1°C

(d) Combined: $+2^{\circ}\text{C}$

Concluding remarks

- Frazil ice enhances marine ice accretion and limits supercooling with implications for ice shelf mass balance and dense water formation
- Freshwater from melting ice shelves inhibits AABW formation by 2.8 times.
- A warming of +1 can potentially remove the Amery Ice Shelf in 500 years
- AABW production will shutdown with a combined 40 % reduction in polynyas and a 1°C warming of CDW

Concluding remarks

- With respect to modelling Antarctic coastal oceans, subgridscale icebergs influence AABW formation and melting of ice shelves.
- Parameterisation in ECCO2?
- Global models (such as ECCO) without dynamic frazil models should at least limit the supercooling due to ice-shelf/ocean interaction
- Remove in 1 timestep?
- Regional models can provide fluxes for global models

A dramatic movie poster for 'The Day After Tomorrow'. The central image shows the White House, which has been transformed into the hull of a large, white, modern ship. This ship is struggling against a massive, dark, and turbulent wave that is crashing over its bow. The sky is filled with heavy, dark clouds, with a sliver of light visible on the right side. The overall tone is one of intense action and disaster.

THE DAY AFTER TOMORROW
WHERE WILL YOU BE?

IN THEATERS WORLDWIDE MAY 28, 2004

Comunity Ice-Shelf Ocean Model

Goal: Develop a fully coupled ice-sheet/ocean model to investigate links between climate change, ice-shelf melting and bottom-water formation and sea level rise.

Some potential collaborators:

Ben Galton-Fenzi, John Hunter, Nathan Bindoff, Frank Colberg, Roland Warner (UTas, ACE CRC, Tasmania)

Mike Dinniman and John Klinck (ODU, Virginia)
